Abstract: Bone disorders are largely associated with increased morbidity, mortality, and substantial economic and health costs. Vitamin D play an important role for calcium absorption and bone mineralization, which can improve the patients' quality of life. The current study aimed to evaluate the potential of The Trivedi Effect®- Biofield Energy Healing on vitamin D₃ and DMEM as test item (TI) on bone cell differentiation using human osteoblast cell line (MG-63, Osteosarcoma). Bone health biomarkers such as alkaline phosphatase enzyme (ALP) activity, collagen levels and bone mineralization were evaluated. The test items were treated with The Trivedi Effect® by William Dean Plikerd and divided as Biofield Energy Treated (BT) and untreated (UT) test items. Cell viability using MTT data showed that the test items were found to be safe. ALP level was significantly increased by 346.4% (at 50 µg/mL), 375.3% (at 100 µg/mL), and 343.2% (at 100 µg/mL) in the UT-DMEM+BT-TI, BT-DMEM+UT-TI, and BT-DMEM+BT-TI groups, respectively as compared to the untreated group. Collagen content was significantly increased by 336.2% and 237.2% in the UT-DMEM+BT-TI at 10 and 50 µg/mL, respectively while 399.3% (10 µg/mL) and 200% (0.1 µg/mL) increased collagen in the BT-DMEM+UT-TI and BT-DMEM+BT-TI groups, respectively. Moreover, the percent of bone mineralization was significantly increased in UT-DMEM+BT-TI, BT-DMEM+UT-TI, and BT-DMEM+BT-TI groups by 416.9% (10 µg/mL), 460.7% (0.1 µg/mL), and 441.7% (10 µg/mL) respectively as compared with the untreated test item and DMEM group. Thus, Biofield Energy Treated vitamin D₃ and DMEM would play an important role to control the osteoblast function, improves bone mineralization, and calcium absorption in many bone disorders. Moreover, the bone health parameters such as collagen, calcium and ALP were significantly improved and can be used as supplement to improve bone health. Based on the outstanding results, it is assumed that the Biofield Energy Treated vitamin D₃ could be a powerful alternative dietary sources and supplements to fight against various bone related diseases including low bone density and osteoporosis, osteogenesis imperfecta, Paget's disease of bone, rickets, osteomalacia, bone and/or joint pain, increased frequency of fractures, deformed bones, osteoma, chondrodystrophia fetalis, hormonal imbalance, stress, aging, bone loss and fractures.

1. Introduction

Vitamin D has multiple effects which regulate the functions in different organs such as brain, lungs, liver, kidneys, heart, immune, skeletal, and reproductive systems. Moreover, it has significant anti-inflammatory, anti-arthritic, anti-osteoporosis, anti-stress, anti-aging, anti-apoptotic, wound healing, anti-cancer, anti-psychotic, and anti-fibrotic roles. Vitamin D receptors (VDRs) are widely present in most of the body organs like brain, heart, lungs, kidney, liver,
pancreas, large and small intestines, muscles, reproductive, nervous system, etc. [1]. VDRs influence cell-to-cell communication, normal cell growth, cell differentiation, cell cycling and proliferation, hormonal balance, neurotransmission, skin health, immune and cardiovascular functions. Bone-related health issues become a major problem among the population from village to the cities. Vitamin D plays a vital role in preserving a healthy mineralized skeleton of most of the vertebrates including humans. Cod liver oil, irradiation of other foods including plants, sunlight, etc. are found to be effective against bone related disorders, which lead to discovering the active principle- vitamin D [1]. The role of vitamin D has been well defined not only for improving the bone mineralization but also with increased bone resorption, aging, inflammation and overall quality of life. Vitamin D3 is synthesized in the skin by sunlight and once formed it sequentially metabolized in the liver and kidney to 1,25-dihydroxyvitamin D (calcitriol, the vitamin D hormone) [2]. Calcitriol play an important role in maintaining the normal level of calcium and phosphorus, promotes bone mineralization, induce or repress the genes related disorders, which lead to discovering the active principle-vitamin D [1]. The role of vitamin D has been well defined not only for improving the bone mineralization but also with increased bone resorption, aging, inflammation and overall quality of life. Vitamin D3 is synthesized in the skin by sunlight and once formed it sequentially metabolized in the liver and kidney to 1,25-dihydroxyvitamin D (calcitriol, the vitamin D hormone) [2]. Calcitriol play an important role in maintaining the normal level of calcium and phosphorus, promotes bone mineralization, induce or repress the genes related disorders, which lead to discovering the active principle-vitamin D [1].

Vitamin D insufficiency and deficiency is the major health problem, which causes metabolic bone disease in the young and elderly populations [4]. Fortified foods have a variable amount of vitamin D and most of the foods do not contain vitamin D3, which can be fulfilled using some supplements. In order to avoid the bone related disorders such as osteomalacia, exacerbate osteoporosis, hyperparathyroidism, immune disorders, etc. calcium 1000-1500 mg/day along with vitamin D supplement around 400 IU/day is very important for maintaining the good bone health [5].

Various *in vitro* studies have readily demonstrated the role of bone health using cell lines and its resoring effects using three important key biomarkers, such as alkaline phosphatase (ALP), collagen and calcium. MG-63 cell line derived from juxtaocular osteosarcoma, which represents an immature osteoblast phenotype and undergoes temporal development in long term culture. The response of MG-63 cells to 1,25-dihydroxyvitamin D3 (1,25 (OH)2 D3) administration has been studied to be similar to normal human osteoblast cells [6]. Hence, MG-63 cell line is widely used for studying the potential of any test compounds to improve the bone health [7]. The formation of new bone involves a complex series of events including the proliferation and differentiation of osteoblasts, and eventually the formation of a mineralized extracellular matrix. ALP is a phenotypic marker for the early differentiation and maturation of osteoblasts. ALP increases the local concentration of inorganic phosphate for bone mineralization and hence is an important marker for osteogenic activity [8]. Similarly, active osteoblasts synthesize and extrude collagen, which plays an important role in the formation of bone extracellular matrix by providing strength and flexibility. Collagen fibrils formed an arrays of an organic matrix known as Osteoid [9]. Likewise, calcium phosphate is deposited in the Osteoid and gets mineralized (combination of calcium phosphate and hydroxyapatite) and provides rigidity to the bone [10]. Thus, these parameters are very essential in order to study the bone health in cell lines. Authors evaluated the *in vitro* effect of the Biofield Energy Treated vitamin D3 as a test item, a Complementary and Alternative Medicine (CAM) on bone health using MG-63 cell line for major biomarkers.

Within the burgeoning ground of CAM therapies, Biofield Energy Treatment or energy medicine, is emerging with significant benefits in various scientific fields. The effects of the CAM therapies have great potential, which include external qigong, Johrei, Reiki, therapeutic touch, polarity therapy, pranic healing, deep breathing, yoga, Tai Chi, Qi Gong, chiropractic/osteopathic manipulation, meditation, massage, special diets, homeopathy, progressive relaxation, guided imagery, acupressure, acupuncture, relaxation techniques, hypnotherapy, healing touch, movement therapy, pilates, Rolfig structural integration, mindfulness, Ayurvedic medicine, traditional Chinese herbs and medicines in biological systems both *in vitro* and *in vivo* [11]. Biofield Energy Healing Treatment (The Trivedi Effect®) contain a putative bioenergy, which is channeled by a renowned practitioners from a distance. Biofield Energy Healing as a CAM showed a significant results in biological studies [12]. However, the National Center for Complementary and Alternative Medicine (NCCAM), well-defined Biofield therapies in the subcategory of Energy Therapies [13]. The Trivedi Effect®: Consciousness Energy Healing Treatment has been reported with significant revolution in the physicochemical properties of metals, chemicals, ceramics and polymers [14-17], improved agricultural crop yield, productivity, and quality [18-20], transformed antimicrobial characteristics at genetic level [21-23], biotechnology [24-26], skin health [27, 28], nutraceuticals [29, 30], cancer research [31, 32], and human health and wellness.

Based on the significant outcomes of Biofield Energy Treatment and vital role of vitamin D3 on bone health, authors sought to evaluate the impact of the Biofield Energy Treatment (The Trivedi Effect®) on vitamin D3 as test sample for bone health activity with respect to the assessment of different bone health parameters like ALP, collagen content, and bone mineralization using standard *in vitro* assays in MG-63 cells.

### 2. Material and Methods

#### 2.1. Chemicals and Reagents

Rutin hydrate was purchased from TCI, Japan, while vitamin D3 (denoted as test item) and L-ascorbic acid were obtained from Sigma-Aldrich, USA. Fetal bovine serum...
(FBS) and Dulbecco's Modified Eagle's Medium (DMEM) were purchased from Life Technology, USA. Antibiotics solution (penicillin-streptomycin) was procured from HiMedia, India, while 3-(4, 5-diamethyl-2-thiazolyl)-2, 5-diphenyl-2H-tetrazolium) (MTT), Direct Red 80, and ethylene diamine tetra acetic acid (EDTA) were purchased from Sigma, USA. All the other chemicals used in this experiment were analytical grade procured from India.

2.2. Cell Culture

Human bone osteosarcoma cell line -MG-63 was used as test system in the present study. The MG-63 cell line was maintained in DMEM growth medium for routine culture supplemented with 10% FBS. Growth conditions were maintained as 37°C, 5% CO₂ and 95% humidity and subcultured by trypsinisation followed by splitting the cell suspension into fresh flasks and supplementing with fresh cell growth medium. Three days before the start of the experiment (i.e., day -3), the growth medium of near-confluent cells was replaced with fresh phenol-free DMEM, supplemented with 10% charcoal dextran stripped FBS (CD-FBS) and 1% penicillin-streptomycin [33].

2.3. Experimental Design

The experimental groups consisted of cells in baseline control, vehicle control groups (0.05% DMSO with Biofield Energy Treated and untreated DMEM), positive control group (rutin hydrate) and experimental test groups. The experimental groups included the combination of the Biofield Energy Treated and untreated vitamin D₃/DMEM. It consisted of four major treatment groups on specified cells with Untreated-DMEM + Untreated-Test item (UT-TI), UT-DMEM + Biofield Energy Treated test item (BT-TI), BT-DMEM + UT-TI, and BT-DMEM + BT-TI.

2.4. Consciousness Energy Healing Treatment Strategies

The test item and DMEM were divided into two parts. One part each of the test item and DMEM was treated with the Biofield Energy by a renowned Biofield Energy Healer (also known as The Trivedi Effect®) and coded as the Biofield Energy Treated item, while the second part did not receive any sort of treatment and was defined as the untreated samples. This Biofield Energy Healing Treatment was provided by William Dean Plikerd remotely for ~5 minutes. Biofield Energy Healer was remotely located in the USA, while the test samples were located in the research laboratory of Dabur Research Foundation, New Delhi, India. This Biofield Energy Treatment was administered for 5 minutes through the Healer’s unique Energy Transmission process remotely to the test samples under laboratory conditions. The Biofield Energy Healer, in this study never visited the laboratory in person, nor had any contact with the test item and medium. Further, the control group was treated with a sham healer for comparative purposes. The sham healer did not have any knowledge about the Biofield Energy Treatment. After that, the Biofield Energy Treated and untreated samples were kept in similar sealed conditions for experimental study.

2.5. Determination of Non-Cytotoxic Concentration

The cell viability was performed by MTT assay in human bone osteosarcoma cell line (MG-63). The cells were counted and plated in 96 well plates at the density corresponding to 5 X 10³ to 10 X 10³ cells/well/180 µL of cell growth medium. The above cells were incubated overnight under growth conditions and allowed the cell recovery and exponential growth, which were subjected to serum stripping or starvation. The cells were treated with the test item, DMEM, and positive control. The untreated cells were served as baseline control. The cells in the above plate (s) were incubated for a time point ranging from 24 to 72 hours in CO₂ incubator at 37°C, 5% CO₂, and 95% humidity. Following incubation, the plates were taken out and 20 µL of 5 mg/mL of MTT solution were added to all the wells followed by additional incubation for 3 hours at 37°C. The supernatant was aspirated and 150 µL of DMSO was added to each well to dissolve formazan crystals. The absorbance of each well was read at 540 nm using Synergy HT micro plate reader, BioTek, USA [34]. The percentage cytotoxicity at each tested concentrations of the test substance were calculated using the following equation (1):

\[
\text{% Cytotoxicity} = (1-X/R) \times 100
\]

Where, \(X = \text{Absorbance of treated cells; } R = \text{Absorbance of untreated cells}\)

The percentage cell viability corresponding to each treatment was obtained using the following equation (2):

\[
\text{% Cell Viability} = 100 - \text{% Cytotoxicity}
\]

The concentrations exhibiting ≥70% Cell viability was considered as non-cytotoxic.

2.6. Assessment of Alkaline Phosphatase (ALP) Activity

The cells were counted using an hemocytometer and plated in a 24-well plate at the density corresponding 1 x 10⁴ cells/well in phenol free DMEM supplemented with 10% CD-FBS. Following respective treatments, the cells in the above plate were incubated for 48 hours in CO₂ incubator at 37°C, 5% CO₂, and 95% humidity. After 48 hours of incubation, the plate was taken out and processed for the measurement of ALP enzyme activity. The cells were washed with 1X PBS and lysed by freeze thaw method i.e., incubation at -80°C for 20 minutes followed by incubation at 37°C for 10 minutes. To the lysed cells, 50 µL of substrate solution i.e., 5 mM of p-nitrophenyl phosphate (pNPP) in 1M diethanolamine and 0.24 mM magnesium chloride (MgCl₂) solution (pH 10.4) was added to all the wells followed by incubation for 1 hour at 37°C. The absorbance of the above solution was read at 405 nm using Synergy HT micro plate reader (Biotek, USA). The absorbance values obtained were normalized with substrate blank (pNPP solution alone) absorbance values [33]. The percentage increase in ALP
enzyme activity with respect to the untreated cells (baseline group) was calculated using equation (3):

\[
\% \text{ Increase} = \frac{X-R}{R} \times 100 \quad (3)
\]

Where, \( X \) = Absorbance of cells corresponding to positive control and test groups
\( R \) = Absorbance of cells corresponding to baseline group (untreated cells)

2.7. Assessment of Collagen Synthesis

The MG-63 cells were counted using an hemocytometer and plated in 24-well plate at the density corresponding to \( 10 \times 10^3 \) cells/well in phenol free DMEM supplemented with 10% CD-FBS. Following respective treatments, the cells in the above plate were incubated for 48 hours in CO\(_2\) incubator at 37°C, 5% \( \text{CO}_2\), and 95% humidity. After 48 hours of incubation, the plate was taken out and the amount of collagen accumulated in MG-63 cells corresponding to each treatment was measured by Direct Sirius red dye binding assay. In brief, the cell layers were washed with PBS and fixed in Bouin’s solution (5% acetic acid, 9% formaldehyde and 0.9% picric acid) for 1 hours at room temperature (RT). After 1 hour of incubation, the above wells were washed with milliQ water and air dried. The cells were then stained with Sirius red dye solution for 1 hour at RT followed by washing in 0.01 N HCl to remove unbound dye. The collagen dye complex obtained in the above step was dissolved in 0.1 N NaOH and absorbance was read at 540 nm using Biotek Synergy HT micro plate reader. The level of collagen was extrapolated using standard curve obtained from purified Calf Collagen Bornstein and Traub Type I (Sigma Type III) [33]. The percentage increase in collagen level with respect to the untreated cells (baseline group) was calculated using equation (4):

\[
\% \text{ Increase} = \frac{X-R}{R} \times 100 \quad (4)
\]

Where, \( X \) = Collagen levels in cells corresponding to positive control and test groups
\( R \) = Collagen levels in cells corresponding to baseline group (untreated cells)

2.8. Assessment of Bone Mineralization by Alizarin Red S Staining

The MG-63 cells were counted using an hemocytometer and plated in 24-well plate at the density corresponding to \( 10 \times 10^3 \) cells/well in phenol free DMEM supplemented with 10% CD-FBS. Following respective treatments, the cells in the above plate were incubated for 48 hours in CO\(_2\) incubator at 37°C, 5% \( \text{CO}_2\), and 95% humidity to allow cell recovery and exponential growth. Following overnight incubation, the above cells will be subjected to serum stripping for 24 hours. The cells will be then be treated with non-cytotoxic concentrations of the test samples and positive control. After 3-7 days of incubation with the test samples and positive control, the plates were taken out cell layers and processed further for staining with Alizarin Red S dye. The cells were fixed in 70% ethanol for 1 hour, after which Alizarin Red solution (40 μm; pH 4.2) was added to the samples for 20 minutes with shaking. The cells were washed with distilled water to remove unbound dye. For quantitative analysis by absorbance evaluation, nodules were solubilized with 10% cetylpyridinium chloride for 15 minutes with shaking. Absorbance was measured at 562 nm using Biotek Synergy HT micro plate reader [33]. The percentage increase in bone mineralization with respect to the untreated cells (baseline group) was calculated using the following equation (5):

\[
\% \text{ Increase} = \frac{X-R}{R} \times 100 \quad (5)
\]

Where, \( X \) = Absorbance in cells corresponding to positive control or test groups;
\( R \) = Absorbance in cells corresponding to baseline (untreated) group.

2.9. Statistical Analysis

All the values were represented as percentage of respective parameters. For multiple group comparison, one-way analysis of variance (ANOVA) was used followed by post-hoc analysis by Dunnett’s test. Statistically significant values were set at the level of \( p \leq 0.05 \).

3. Results and Discussion

3.1. MTT Assay-Non-Cytotoxic Effect of the Test Item

![Figure 1](image-url). Effect of the test item on MG-63 cell lines for cell viability after 72 hours using the MTT assays. VC: Vehicle control (DMSO-0.05%), UT: Untreated, BT: Biofield Treated, TI: Test Item.
The cell viability of the test samples were studied in MG-63 cells. The obtained results were compared with respect to rutin at defined concentrations for the estimation of percentage cell viability. The cell viability results are graphically presented in Figure 1. The results of percentage cell viability in all the tested cell lines showed the cell viability range of 70% to 114% in different test item groups with DMEM, while for rutin group showed more than 85% cell viability (Figure 1). These data suggests that the test item along with DMEM groups were found safe at all the tested concentrations range up to maximum of 100 µg/mL against the tested MG-63 cells.

3.2. Assessment of Test Items Effects on Alkaline Phosphatase (ALP) Enzyme Activity

The effect of the Biofield Energy Treated test item and DMEM on the ALP level showed a significantly increased at various experimental test item concentrations on MG-63 cell line (Figure 2). The positive control, rutin showed a significant increased value by 38.78%, 43.61%, and 80.92% at 0.01, 0.1, and 1 µg/mL, respectively with respect to the untreated cells. The experimental test group’s viz. untreated medium and Biofield Treated Test item (UT-DMEM+BT-TI) showed a significant increase in ALP level by 38.8%, 346.4%, and 44.7% at 10, 50, and 100 µg/mL, respectively while Biofield Treated medium and untreated Test item (BT-DMEM+UT-TI) showed a significant increased ALP level by 50.8% and 375.3% at 50 and 100 µg/mL, respectively as compared with the untreated test item and DMEM group. However, the Biofield Energy Treated medium and Biofield Energy Treated Test item (BT-DMEM+BT-TI) showed a significant increased ALP level by 343.2% at 100 µg/mL as compared with the untreated test item and DMEM group. Overall, all the experimental test groups showed a significant improved level of ALP at the tested concentrations.

[Figure 2. Effect of the test items on MG-63 cell line for the level of Alkaline Phosphatase (ALP) enzyme activity. VC: Vehicle control (DMSO-0.05%), UT: Untreated; BT: Biofield Treated; TI: Test Item.]

Bone ALP enzyme is very important for bone mineralization and calcification. It is defined as the phenotypic clinical marker detection of osteoblasts differentiation and maturation. ALP increases the local concentration of inorganic phosphate for bone mineralization and osteogenic activity. ALP is reported to improve the local concentration of inorganic phosphate, a mineralization promoter along with inhibition of extracellular pyrophosphate concentrations, an inhibitor of mineral formation. The Trivedi Effect®-Energy of Consciousness Healing based vit D3 and DMEM reported to improve the ALP concentration as compared with the untreated groups. Thus, it might improve the ALP expression, which is a good predictor of neotissue mineralization and could provide beneficial therapeutic prospects for the treatment of various bone diseases [35].

3.3. Effect of Test Items on Collagen Synthesis

The effect of the Biofield Energy Treated vit D3 and DMEM on the collagen level showed a significant increase in the collagen level at various experimental tested concentrations. The results in term of% increase in collagen synthesis are presented in Figure 3. The positive control, rutin showed a significant increased value of collagen by 46.6%, 30.3%, and 39.7% at 5, 10, and 25 µg/mL, respectively. The experimental test group’s viz. UT-DMEM+BT-TI showed a significant increased collagen level by 336.2%, 237.2%, and 36.9% at 10, 50, and 100 µg/mL, respectively while BT-DMEM+UT-TI group showed a significant increased collagen level by 399.3%, 28.1%, and 48.2% at 10, 50, and 100 µg/mL, respectively as compared with the untreated test item and DMEM group. However, BT-DMEM+BT-TI group showed a significant increased collagen level by 200%, 110.2%, 71.3%, and 97.2% at 0.1, 10, 50, and 100 µg/mL, respectively as compared with the untreated test item and DMEM group. Overall, all the experimental Biofield Energy Treated test item and DMEM groups showed a significant improved level of collagen at all the tested concentrations compared with the untreated group.
Collagen is the main component in bone for bone tissue regeneration, enhanced bone apatite formation and is considered as the most abundant protein [36]. Collagen defines the bone strength, which not only depends on the quantity of bone tissue but also on its quality, which is categorized by the geometry and the shape of bones, collagen content, minerals, microarchitecture of the trabecular bones, and its turnover [37]. Thus it can be concluded that Biofield Energy (The Trivedi Effect®) Treated vit D₃ and DMEM would be an important source to improve the level of collagen and its mineralization process against different orthopedic diseases.

3.4. Effect of Test Items on Bone Mineralization

The Biofield Energy Treated test item and DMEM were studied on bone mineralization and data showed a significant increase in the bone mineralization process at various experimental tested concentrations on MG-63 cell line. The results of bone mineralization among different groups has been presented in Figure 4. The positive control, rutin showed a significant increased value of bone mineralization by 48%, 59.7%, and 139.0% at 5, 10, and 25 µg/mL, respectively. The experimental test group’s viz. UT-DMEM+BT-TI showed a significant increased bone mineralization by 416.9% at 10 µg/mL, while BT-DMEM+UT-TI group showed a significant increased bone mineralization by 460.7%, 49.4%, 23.1%, and 20.6% at 0.1, 10, 50, and 100 µg/mL, respectively as compared with the untreated test item and DMEM group. However, BT-DMEM+BT-TI group showed a significant increased bone mineralization by 441.7%, 17.9%, and 16.7% at 10, 50, and 100 µg/mL, respectively as compared with the untreated test item and DMEM group. Overall, all the experimental Biofield Energy Treated test item and DMEM groups showed a significant improved level of bone mineralization at the tested concentrations.
4. Conclusions

The experimental results showed a significant effect of Biofield Energy Healing Treatment on vitamin D3 and DMEM for bone health in MG-63 cell line. Cell viability test using MTT assay showed a significant improved cell viability with more than 80% cell viability among different test groups, while Biofield Energy Treated test vitamin D3 and DMEM also improved the cell viability as compared with the untreated group. Cell viability test using MTT assay showed that the test items were safe and nontoxic in all the tested concentrations. After Biofield Energy Healing Treatment, the concentration of ALP was significantly increased by 343.2% and 375.3% in the BT-DMEM+BT-TI and BT-DMEM+UT-TI groups, respectively at 100 µg/mL, while 346.4% increased ALP was reported in the UT-DMEM+BT-TI group at 50 µg/mL, as compared to the untreated group. In addition, the level of bone mineralization was significantly increased by 336.2% and 237.2% in the UT-DMEM+BT-TI group at 10 and 50 µg/mL, respectively, while 399.3% (10 µg/mL) and 200% (0.1 µg/mL) increased collagen in the BT-DMEM+UT-TI and BT-DMEM+BT-TI groups, respectively as compared to the untreated group. Similarly, the percent of bone mineralization was significantly increased by 416.9% at 10 µg/mL in the UT-DMEM+BT-TI group, while BT-DMEM+UT-TI group showed increased bone mineralization by 49.4%, 23.1%, and 20.6% at 10, 50, and 100 µg/mL, respectively as compared with the untreated group. In addition, bone mineralization in MG-63 cells was increased by 441.7% in the BT-DMEM+BT-TI group at 10 µg/mL, 460.7% at 0.1 µg/mL in BT-DMEM+UT-TI, and 416.9% at 10 µg/mL in UT-DMEM+BT-TI as compared with the untreated group. Overall, the Biofield Energy Treated (The Trivedi Effect®) test samples showed a significant impact on bone health parameters viz. collagen, calcium and ALP, which play a vital role in maintaining bone disorders. Therefore, the Consciousness Energy Healing based vitamin D3 might be suitable alternative nutritional supplement, which could be useful for the management of various bone related disorders viz. low bone density and osteoporosis, osteogenesis imperfecta, Paget’s disease of bone, rickets, osteomalacia, bone and/or joint pain, increased frequency of fractures, deformed bones, osteoma, chondrodystrophia fetalis, and other bone diseases that are caused by poor nutrition, genetics, or problems with the rate of bone growth or rebuilding. Biofield Energy Treated Vitamin D3 can be useful as anti-inflammatory, anti-arthritis, anti-osteoporosis, anti-stress, anti-aging, anti-apoptotic, wound healing, anti-cancer, anti-psychotic and anti-fibrotic roles. It also influence cell-to-cell communication, normal cell growth, cell differentiation, cell cycling and proliferation, hormonal balance, neurotransmission, skin health, immune and cardiovascular functions. Besides, it can also be utilized in organ transplants (for example kidney transplants, liver transplants and heart transplants), hormonal imbalance, aging, and various immune related disease conditions such as Asthma, Ulcerative Colitis, Alzheimer’s Disease, Atherosclerosis, Dermatitis, Diverticulitis, Dermatomyositis, Graves’ Disease, Hashimoto Thyroiditis, Multiple Sclerosis, Myasthenia Gravis, Pernicious Anemia, Aplastic Anemia, Sjogren Syndrome, Systemic Lupus Erythematosus, Diabetes, Hepatitis, Irritable Bowel Syndrome, Parkinson’s Disease, stress etc. with a safe therapeutic index to improve overall health and quality of life.
