ABSTRACT

Permanganate oxidation of uracil-4-C14 and 5-nitouracil-4-C14 indicates that in the two compounds ring cleavage occurs both between carbons 4 and 5 and carbons 5 and 6.
THE PERMANGANATE OXIDATION OF URACIL AND 5-NITROURACIL

(*) Present address: Kedzie Chemical Laboratory, Michigan State College, East Lansing, Michigan.

(**) The work described in this paper was sponsored by the U. S. Atomic Energy Commission.

The reaction of uracil with potassium permanganate to yield carbon dioxide and oxalic acid has been of use in the degradation of the pyrimidine ring.1 2

The similar oxidation of 5-nitouracil has been used by Lagerkvist to obtain the distribution of carbon-14 in the uracil of the nucleic acids of rats following the injection of radioactive bicarbonate.3 In this work the assumption was made, following Offe,4 that the oxalic acid fragment obtained upon hydrolysis of oxalic acid was derived from carbon atoms 4 and 5 of the pyrimidine.***

(***) The numbering of the pyrimidine ring is in conformance with current usage of Chemical Abstracts.
It was felt that the determination of the course of these reactions might prove of value in tracer experiments on the biological synthesis of the pyrimidine compounds. Accordingly, uracil-$4-C^{14}$ and 5-nitouracil-$4-C^{14}$ were synthesized and subjected to permanganate oxidation. As shown in Table I, high percentages of the isotope were found in each carbon dioxide and the oxalic acid fraction of the two pyrimidines, indicating that ring cleavage had occurred both between carbons 4 and 5 and carbons 5 and 6, with the last reaction predominating to some extent. In its present form the method offers little value as a degradative procedure, and therefore the interpretation of the results of Lagerkvist is seriously in doubt.

Experimental

Uracil-$4^{-14}C$. The method of Davidson and Baudisch\textsuperscript{5} was used for the synthesis of uracil from urea and a sample of malic acid-$4^{-14}C$ prepared in this laboratory by methods recently described.\textsuperscript{6} The identity and purity of the twice-recrystallized uracil-$4^{-14}C$ were established by the determination of the ultraviolet absorption spectrum in 0.01 M HCl. Both the $\epsilon_{\text{max}}$ and the ratio of optical densities at 260 to 280 m$\mu$ agreed to within 1% with published data.\textsuperscript{7}

\textsuperscript{5} D. Davidson and O. Baudisch, J. Am. Chem. Soc. \textbf{48}, 2379 (1926).

\textsuperscript{7} J. M. Ploeser and H. S. Loring, J. Biol. Chem. \textbf{178}, 431 (1949).

5-Nitouracil-$4^{-14}C$. The method of Johnson and Matsuo\textsuperscript{8} was used for the preparation of 5-nitouracil from a portion of the uracil-$4^{-14}C$ diluted somewhat with non-radioactive uracil. The gain in weight during this process was 94% of theory. The material was recrystallized once from water.

Oxidation of Uracil-$4^{-14}C$. The procedures described by Heinrich and Wilson\textsuperscript{1} for the cleavage of the pyrimidine ring, collection of the CO$_2$, hydrolysis of the oxaluric acid, precipitation of calcium oxalate and its subsequent oxidation to CO$_2$ were followed closely, except that the pH of the reacting solution was maintained between 5 and 7 with the aid of a pH meter.

Oxidation of 5-Nitouracil. The method of Offe\textsuperscript{4} was followed for the oxidation step, followed by procedures similar to those mentioned for uracil.
