VC Reduplication in Sayula Popoluca

Richard A. Rhodes  
*University of California, Berkeley*

**Abstract.** Sayula Popoluca, a Mixe-Zoquean language of southern Mexico, shows three types of reduplication, two which use full or only slightly modified copies of the root and one which copies only the final VC of a CVC root. The three types of reduplication are outlined. The synchronic pattern of VC reduplication is complicated by morphophonemics that renders the pattern opaque in many cases. As a result, many of the tokens have not previously been recognized as examples of VC reduplication. The pattern of VC reduplication is fully explicated, including all its interactions with the morphophonemics of the language, including those that apply primarily only in reduplication, and those that apply optionally.

This pattern of reduplication is more widespread in Sayula Popoluca than in any related language. The history of VC reduplication throughout the Mixe-Zoquean family is discussed including an examination of the evidence that VC reduplication spread independently in specific subbranches of both Zoquean and Mixean. A proposal is put forward that VC reduplication, which is never productive, spreads by analogy.

**Keywords.** Sayula Popoluca, Mixe-Zoquean, reduplication, language history

1.

Sayula Popoluca is a Mixe-Zoquean language of Mexico. The languages of the Mixe-Zoquean family fall into two branches which occupy a sizeable portion of southern Mexico around the Isthmus of Tehuantepec. The Zoquean branch is found on the north side of the Isthmus on or near the Gulf of Mexico in the states of Veracruz and Tabasco and stretching southeastward into neighboring Chiapas. The Mixean branch lies to the south and west of the Zoque languages and stretches west to east from the central highlands of Oaxaca and northeasterward down into Veracruz. In the rainforest lowlands at the northeastern edge of the Mixe territory are two small languages, Sayula Popoluca and Oluta Popoluca.

This paper explores the synchronic and diachronic aspects of an often highly opaque reduplication pattern in Sayula Popoluca roots in which the reduplication runs rightward by adding a copy of the final VC of the root. Some examples are given in (1).

(1)  
\begin{align*}
  \text{tsùnum-p} & \quad \text{'it rattles'} \\
  \text{tšiní-n-w} & \quad \text{'it dangles'} \\
  \text{hóol-w-p} & \quad \text{'it [clothing] is loose'}
\end{align*}
Reduplicated stems of this sort are fairly common in Sayula Popoluca. Almost 3% of the nearly 3000 known lexical roots of Sayula Popoluca undergo this reduplication, and most of them do so obligatorily. From a diachronic perspective this reduplication is interesting because VC reduplication has spread dramatically in the Mixe branch of the family of which Sayula Popoluca is a member.

2.

Sayula Popoluca and Mixe-Zoquean languages in general show three distinct types of reduplication.

2.1.

Both branches of the family have full reduplication as a common lexical construction. The meanings of these full reduplications are typical of the meanings of reduplications cross-linguistically: intensificational, pluractional (in a loose sense), and names of flora and fauna. Some representative examples are given in (2).

(2) (a) Sayula Popoluca
    tsântsâns      ‘foul odor’
    pisâpis        ‘sp. cowbird’
(b) other Mixean
    Totontepec Mixe
    tuktuk         ‘it inflated’
(c) Zoquean
    Copainalá Zoque
    taketake       ‘spider web’
    tâijâij        ‘very small’

The details of the patterns of full reduplication vary slightly from language to language across the Mixe-Zoquean family. In Sayula Popolucia full reduplication includes the neutralization of vowel nucleus type in the righthand member. Sayula Popoluca has three types of vowel nuclei, short, long, and laryngeal (written V, V; and V? respectively). In full reduplication, the righthand member of the reduplicated form neutralizes these distinctions in nucleus type to short. Examples are given in (3).

(3) tfékkték    ‘algae’
    wxékkwik     ‘sp. of curassow’
    kišškis      ‘scrawny, emaciated’
    tfùûntfùun   ‘grasshopper’

2.2.

The second type of reduplication in Sayula Popoluca is also found widely in Mixe-Zoquean. Type II reduplication is full reduplication in specialized construction. The
construction in question has reduplicated stems suffixed with the locative derivational suffix \(-na(\text{j})\). In its most basic use the morpheme \(-na(\text{j})\), which has no semantics of its own, is added to a large number of positional morphemes, many of which do not occur unsuffixed. This type of morphological construction is areal in Meso-America. Some examples are given in (4), where the (i)’s show a simple \(-na(\text{i})\)-construction and the (ii)’s show type II reduplication.

(4)  
(a) Sayula Popoluca  
(i) \text{ten-} \text{has-} \phantom{\text{p}}  \text{‘stand’} \text{tē-} \text{na-p} \phantom{\text{p}} \text{‘he stands’}  
\text{ko-} \phantom{\text{p}} \text{‘squatting’} \text{kō-} \text{na-p} \phantom{\text{p}} \text{‘he is squatted down’}  
(ii) \text{koʔ-p} \text{‘he crawls’} \text{kōʔwkoʔ-w-} \text{na-p} \phantom{\text{p}} \text{‘he crawls all over’}  
\text{tsut-p} \text{‘he hops’} \text{tsůh-tsut-} \text{na-p} \phantom{\text{p}} \text{‘he hops around’}  
\text{weʔts} \text{‘wide-hipped’} \text{weʔits-} \text{weʔts-} \text{na-p} \phantom{\text{p}} \text{‘she walks swaying her hips’}  
(b) Copainalá Zoque  
(i) \text{te-} \text{hap-} \phantom{\text{p}} \text{‘standing’} \text{te-} \text{na-pja} \phantom{\text{p}} \text{‘he is standing’}  
\text{woh-} \phantom{\text{p}} \text{‘open’} \text{woh-} \text{na-pja} \phantom{\text{p}} \text{‘it is open’}  
(ii) \text{mihा} \text{‘big’} \text{mihamih-} \text{na-pja} \phantom{\text{p}} \text{‘he is proud’}  
\text{sik-pa} \text{‘he laughs’} \text{siṣik-} \text{na-pja} \phantom{\text{p}} \text{‘he smiles’}  
\text{jos-pa} \text{‘he works’} \text{josjoj-} \text{pa-pja} \phantom{\text{p}} \text{‘he does work’}

Notice that in Sayula Popoluca Type II reduplication does not entail any neutralization of vowel nucleus type, as can be see in (4a[iii]).

2.3.

The third and last type of reduplication in Sayula Popoluca is a rightward reduplication of the final VC of a root. Examples are given in (5) (cf. also the examples in [1] above).

(5) \text{tsámam-p} \phantom{\text{p}} \text{‘it oozes up from the ground’}  
\text{hinin-w} \phantom{\text{p}} \text{‘it decomposed’}  
\text{tʃóloʃ-p} \phantom{\text{p}} \text{‘it makes the sound of water falling’}  
\text{hójoj} \phantom{\text{p}} \text{‘round’}  
\text{ʃoʃoʃ} \phantom{\text{p}} \text{‘sweat’}

Rightward reduplication of the final VC is found elsewhere in the family, but it is not as common in the other languages as it is in Sayula Popoluca.
(6) (a) Mixean
   Totontepec Mixe  vjidit  '(that) he walked' (cf. vítp 'he walks')
   Oluta Popoluca  komoʔm\textsuperscript{1}  'post, pole'
   Sayula Popoluca  hásas-w  'he slipped on gravel'
   \textit{jimm}-w  'it drizzled'

(b) Zoquean
   Copainalá Zoque  tonon-u  'it drizzled'
   \textit{tokoʔ}  'dry corn husk leaf'
   Soteapan  majaj  'thin'

I will devote next two sections of this paper to exploring this type of reduplication in Sayula Popoluca. I will then conclude with a discussion the historical spread of this reduplication in Sayula Popoluca.

3.

The basic pattern of VC reduplication is given in (7).

(7) VC reduplication
    \( CV_1C_1 \rightarrow CV_1C_1C_1 \)

Some examples are given in (5) above.

3.1.

But the examples in (5) don't tell the whole story. Most of the instances of VC reduplication in Sayula Popoluca show a further modification of the medial consonant. The examples in (1) and (5) were chosen because their consonants cannot generally undergo any modification. The one exception is that most of the reduplicated forms in \( s \) have a variant with the medial consonant appearing as \( h \), as in (8).

(8) \( ñóʔos \sim ñóʔos \quad 'sweat' \)
    \( kásas-p \sim ká̱hás-p \quad 'he slips on gravel' \)
    \( ñi késes-p \sim ñi késes-p \quad 'he slides it' \)
    \( pósos \sim póʔos \quad 'guayaba (sp. of fruit)'\textsuperscript{2} \)
    but not \( píchás-p \quad 'it disintegrates into a powder' \)
    \( hásas-p \quad 'he makes the sound of slipping on gravel' \)

When the reduplicated consonant is a stop, the medial instance is voiced. Some examples are given in (9).

---
\textsuperscript{1} Oluta regularly adds a glottal stop in a closed second syllable of disyllabic roots. More on this later.

\textsuperscript{2} Like \( póʔok \) mentioned in (9) below. Clark (1981) cites this form with long vowels, but he does so inconsistently, and only forms with short vowels were collected independently by more than one fieldworker in connection with the PDLMA.
VC Reduplication in Sayula Popoluca

(9)  
?abap-w  ‘it [plant] extended itself’
?i kébep-w  ‘he dragged it’
tidit-p  ‘it is thundering’
jádat-p ~ járat-p  ‘he is shivering’
?i kéret-p  ‘he scratches it’
négek-p  ‘he is loading firewood’
hógok-p  ‘he snores’

In the case of the apical, the voiced version can also appear as a flap. It depends on the particular word whether it has d or r or either. A complete list of the forms based on roots in t is given in (10).

(10)  
(a) only d
    ?i kúdat-w  ‘he scratched [his head]’
tidit-p  ‘it is thundering’
(b) either d or r
    jádat-p ~ járat-p  ‘he is shivering’
(c) only r
    hórot  ‘wide hole’
húrút  ‘the sound of diarrhea’
hírit-w  ‘he dragged himself across the gravel’
?i kéret-p  ‘he scratches it’
lárat-p  ‘it’s thundering’
múrut-p  ‘it is spurting’
?i mírit-w  ‘he crushed down on it’
núrut  ‘squeaky clean [skin]’
sírit-w  ‘a lot of it fell’

Voicing in obstruents is marginally contrastive in Sayula Popoluca. There are some near minimal pairs as in (11), but clear instances of contrast are very few. With the exception of g, voiced obstruents are uncommon in native words outside of VC reduplication.

(11)  
uncommon normal
hóhom  ‘tomorrow’  hápam-p  ‘he kneads with the heel of the hands’
múrut-p  ‘it is spurting’  hútuk-p  ‘he is awake’
túkun  ‘amuchi (sp. of fruit)’  múgik  ‘hard’

VC reduplication of a stop obstruent always feeds voicing. The details of obstruent voicing in Sayula Popoluca are discussed in Rhodes (2004).

3.2.

The connection between VC reduplication and voicing is interesting in that it renders the reduplication opaque, in an intuitive (i.e., non-OT) sense. Sayula Popoluca has
been under study since the 1950’s and VC reduplication has gone largely unnoticed. The opacity effect is even more dramatic in the case of affricates. Sayula Popoluca has two affricates, _ts_ and _tf_. In VC reduplication the medial consonant is reduced to its unmarked counterpart, i.e. _t_, and undergoes voicing like underlying _r_’s. Some examples are given in (12).

(12) \[ CV_1C_1 \rightarrow CV_1C_1V_1C_1 \]

\[ \begin{align*}
?i \ hids-p & \quad \text{'he grinds it'} \\
\kats-p & \quad \text{'he slips'} \\
\hids-p & \quad \text{'he handles it'} \\
\kâdats-p & \quad \text{'he slips (but doesn’t fall)'}
\end{align*} \]

This analysis is supported historically in that the few VC reduplications in Oluta involving affricates do not show medial consonant neutralization, and at least one is cognate with a Sayula form.³

(13) \[ \begin{align*}
\text{Oluta} & \\
\text{moïtsots} & \quad \text{‘curled up’} \\
\hids-s\text{-}s\text{-}pe & \quad \text{‘he handles it’ (cf. Sayula ?i \ hids-p \ ‘he handles it’)}
\end{align*} \]

There are many more forms that show the same pattern of _dVts/rVts_ or _dVtf/rVtf_ but which don’t have allomorphic support. A list is given in (14).

(14) \[ \begin{align*}
\hids-p \sim \hârats-p & \quad \text{‘the fire crackles’} \\
\text{hîduts-w} \sim \text{hûruts-w} & \quad \text{‘it slid quickly down a hole’} \\
\text{kîdits-w} & \quad \text{‘it sounded like cloth ripping’} \\
\text{pûduts} & \quad \text{‘pot-bellied’} \\
\text{nûrots} & \quad \text{‘wrinkled [brow]’} \\
\text{mûrîtf-p} & \quad \text{‘he crunches his food’} \\
\text{kirîtf-w} & \quad \text{‘the leather squeaked’} \\
\?i \ kîrîtf-w & \quad \text{‘he put a scratch on it’} \\
\text{wîrîtf-w} & \quad \text{‘his stomach growled’}
\end{align*} \]

Because the pattern is clear from cases like those in (12), we treat all the cases in (14) as instances of VC reduplication.

In cases of VC reduplication, the vowel nucleus type is neutralized. As we discussed in connection with full reduplication (§2.1) above, Sayula Popoluca has three types of vowel nuclei, short, long, and laryngeal. The same neutralization to the least marked vowel nucleus type, i.e., short vowel, that we saw in the second syllable of full reduplication in the forms in (3) above also takes place in the first vowel of VC reduplicated forms, as the examples in (15) show.⁴

---

³ It is possible that medial neutralization and voicing are not historically tied to VC reduplication as shown by the cognates OL katsu’s ‘sour’ (< pre-OLuta *katsuts*). Say: kuduts ‘sour’, but cf. Soteapan katsu. Copainalá katsu ‘sour’. The other possibility is that kuduts is from pMZ, *katsu* by a version of VC reduplication at the devoiced vowel stage: pMixe katsU > *katsU-atsU > katsuts.*

⁴ There are two forms that do not undergo this neutralization, both have long vowels, màgak ‘sterile adj: a sterile person’ and pištis ‘fulvous tree duck’.
VC Reduplication in Sayula Popoluca

(15) \[CV_1C_1 > CV_1C_2V_1C_1\]
- nērētf-p ‘it is grazing’
- ñōts-ik ‘butter’
- wēts ‘wide-hipped’
- tāts-p ‘he urinates’
- nērētf ‘it is grazing’
- ñōts ‘the hot grease crackles’
- wēts-na-p ‘he is seated on the floor cross-legged’
- tādat-p ‘it’s dripping’

4.

The last feature of VC reduplication that needs discussion is that it is lexical and not inflectional. This can be seen in that it precedes all the morphophonemic rules that apply in inflection, as we will now show. All of the following rules have complexities that we will not show here because they do not interact with reduplication. The first rule is nasal assimilation. Only n assimilates, but n’s from VC reduplication all assimilate in the appropriate environments.

(16) nasal assimilation
- tinim-w ‘it was burning’ tinim-p ‘it’s burning’

The second rule is sonorant deletion. When two identical sonorants are adjacent only one appears on the surface. (For convenience in presentation we will treat this as deleting the first sonorant.) Sonorants from VC reduplication all delete in the appropriate environments.

(17) sonorant deletion
- kāy-p ‘he is eating’ kāy-nu-p ‘he is eating now’
- tinim-w ‘it was burning’ tini-nu-p ‘it’s burning now’

The next rule is p deletion. The independent incomplete suffix, -p, triggers the deletion of a stem final p. (This rule bleeds the next rule.)

(18) p deletion
- ñi ¿é?p-w ‘he saw it’ ñi ¿é?p ‘he sees it’
- ñi kébe-w ‘he dragged it’ ñi kébe-p ‘he is dragging it’

The next rule is geminate preaspiration. When two obstruents with the same point of articulation are adjacent the first appears as an h.

(19) geminate preaspiration
- pīt-p ‘he is afraid’ pīt-ka-p ‘they’re afraid’
- nēgak-p ‘he is loading firewood’ nēgak-ka-p ‘they are loading firewood’

5 This form belongs to a class of morphemes that alternates between V: and V′, tāt-ep ‘he urinates’, tāt-′ez ‘he will urinate’. Historically these forms contained a long vowel as argued in Rhodes (2005) (contra Wichman 1995). This data provides some further support for the analysis of the ū as synchronically syllable internal in Sayuleño alternating verbs, in that the vowel neutralization to non-glottal short vowel applies here too. If the glottal were, as Wichmann posits, after the consonant, an extra rule would be needed to delete it.
The next rule is *h* metathesis. An *h* preceding an unstressed vowel metathesizes around a preceding consonant. (Because glottal stop is part of the vowel nucleus, *h* does not metathesize around a glottal.)

\[(20) \quad h \text{ metathesis} \]
\[
\begin{array}{llll}
\tilde{\text{h}}\text{örot} & \tilde{\text{h}}\text{öroht-} & \tilde{\text{h}}\text{öroht-at} & \tilde{\text{h}}\text{öroht} \\
\tilde{\text{h}}\text{örot} & \tilde{\text{h}}\text{o} & \tilde{\text{h}}\text{o} & \tilde{\text{h}}\text{öroht-at} & \tilde{\text{h}}\text{öroht} \\
\text{'that'} & \text{'wide hole'} & \text{'those'} & \text{'wide holes'}
\end{array}
\]

But VC reduplication must actually be pre-lexical, because in addition to feeding all the inflectional morphophonemics, it feeds type II reduplication, as discussed in §2.2. above. The product of VC reduplication can be reduplicated in construction with *-naj-* as show in (21).

\[(21) \quad tsibir-p \quad tsibip-tsibip-na-p \quad \text{‘it drips from an edge’} \quad \text{‘it drips from time to time’} \]

## 5. Diachrony

Now we turn to the question of how VC reduplication developed in Sayula Popoluca. From the outset one thing is clear: VC reduplication is more widespread in Sayula Popoluca than in any other Mixe-Zoquean language. The data in Table I shows that Sayula Popoluca by percentage has more than twice as many VC reduplicants as any other thoroughly documented sister language.\(^6\)

### 5.1.

The first thing we will show about VC reduplication Sayula Popoluca is that most of the instances are innovated rather than inherited. This is potentially controversial because Wichmann (1995) reconstructs a large number of VC reduplicants for various stages of Mixe-Zoquean development, 32 on the most generous reading, including 14 for proto-Mixe-Zoquean. But on close inspection all his reconstructions of VC reduplicants have problems. Leaving aside the four that have problems with segmental correspondences, the remaining ten all have VC reduplicant cognates in

\(^6\) All the word lists in question encompass about 3000-4000 roots. Some are from the Summer Institute of Linguistics, and some are from the Proyecto para la Documentación de las Lenguas de Mesoamérica which employs a very aggressive approach to finding all possible roots.
Mixe but unrepeated cognates in Zoque, and thus are not candidates for the reconstruction of VC reduplication back to proto-Mixe-Zoquean. Wichmann’s reconstructions are included in an appendix so the reader can see what the problems are. In fact the three best candidates for reconstructable proto-Mixe-Zoquean VC reduplicants Wichmann doesn’t even list as Proto-Mixe-Zoquean. They are given in (22).

\[(22) \quad \begin{array}{llll}
\text{a) ‘tool; spindle, spit’ proto-MZ } & \text{‘petet-an} \hspace{1cm} \text{proto-Mixean } & \text{‘petet-an} \\
\text{Copainalá} & \text{petet} & \text{Atitlán} & \text{Guichicovi} \\
\text{‘spindle’} & \text{‘instrument’} & \text{Sayula} & \text{peretan} \\
\text{b) ‘hang down’ proto-MZ } & \text{‘tsinin} \\
\text{proto-Zoquean } & \text{‘tsinin} \\
\text{Francisco León} & \text{‘tsinin} \\
\text{‘be hanging’} & \text{Sayula} & \text{‘dangle’} \\
\text{c) ‘pile’ proto-MZ } & \text{‘tunun} \\
\text{proto-Zoquean } & \text{‘tunun ‘hill’} \\
\text{Francisco León} & \text{Totontepec} & \text{Guichicovi} \\
\text{‘pile up’} & \text{‘túnin} & \text{tun:} \\
\end{array} \]

Even though few VC reduplicated cognates survive, there is evidence that VC reduplication was present in proto-Mixe-Zoquean, since there are examples of reconstructable VC reduplication in both branches, as indicated in (23).

There is also evidence that VC reduplication spreads, to a greater or lesser extent, in all the branches of Mixe-Zoquean except in Gulf Zoque. The following sections give evidence for the spread in Chiapas Zoque, in common Mixean, in Oaxaca Mixean, in Veracruz Mixean\(^7\), and finally in Sayula Popoluca.

\(^7\) The existence of a branch of Mixean that consists of Oluta Popoluca and Sayula Popoluca is controversial. Wichmann (1995) asserts that proto-Mixean split into three branches Oluta, Sayula, and proto-Oaxaca Mixean, but then he proceeds to reconstruct 59 proto-Veracruz-Mixean forms. In Rhodes (2006), I propose, without extensive argument, that Oluta and Sayula form a distinct branch. The argument is based on a single sound change and some crucial semantic innovations. The sound change is the loss of w in the future, innovated in proto-Mixean from wa:hn- ‘want’. The most telling semantic innovation is the use of òe?ò- ‘divert oneself’ to replace òif- ‘see’ in most environments. Missing from the argument at the time was the number of VC reduplicants reconstructable to proto-Veracruz-Mixean. Also missing from the argument is the fact that Oluta and Sayula are 7 km apart in flat land and that they have, in all likelihood been in those locations for 1000 or more years. It would be surprising if they weren’t a single speech community for some significant portion of that time. Given that both are phonologically very conservative varieties of Mixe, it is not surprising that there is only a single common phonological innovation to point to.
5.1.1.

Let us start with instances of spread in Zoquean. Chiapas Zoque, particularly Copainalá, provides us with the best evidence that the VC reduplications found there are due to spread of the pattern rather than a loss of the pattern on the part of the rest of Zoquean. Copainalá has two examples with segments that are new developments in Zoquean. As we noted above Zoquean turned syllable final w’s into ŋ’s. Therefore reflexes of VC reduplications from proto-Zoquean would have medial w and final ŋ, but a VC reduplication created in the daughter languages after w and ŋ have become separate phonemes would have ŋ in both places. Copainalá and Chimalalapa have examples of the former, as shown in (24a), but only Copainalá has examples of the latter as in (24b).

(24) (a) old reduplicants
   (i) Copainalá
      *howon ≥ *howon
      *mjats-kiwuñ-ba ≥ *mjats-kiwuñ-ba
      ‘stove’
      ‘he dunked it’ (cf. kiw- ‘it cooks, ripens’)
   (ii) Chimalalapa
      hawon
      ‘fever’
   
(b) neologisms (both Copainalá)
   kjonon-ba
   ‘he makes it stiff’
   ‘it inflates’ (cf. puy- ‘it inflates’)

Similarly, ŋ is a new phoneme in Copainalá arising originally in certain palatal environments, so any VC reduplication with phonologically unmotivated ŋ’s must be a Copainalá or pre-Copainalá neologism. There is one such.

(25)  *kjojiñu  ‘he desires it’ (Copainalá)

This brings us to proto-Zoquean *jik ‘black’. Wichmann reconstructs a VC reduplicant for proto-Mixe-Zoquean, because there is a VC reduplicant in Santa Maria Chimalalapa, jikik ‘obscure’ next to jik ‘black’. But since no other Zoque has a

---

4 Intervocalic ŋ becomes w in Zoquean.
5 The evidence that the reflexes of VC reduplicated forms in some Oaxaca Mixe languages are CVC monosyllables will be discussed in detail in §5.1.2, below.
reduplicated form for this item.\textsuperscript{10} VC reduplication for it is not reconstructable to proto-Zoquean.

### 5.1.2.

There are at least four forms with VC reduplication reconstructable to proto-Mixean whose Zoquean cognates are unreduplicated. They are given in (26).

At first blush it looks like the spread is in Veracruz Mixeane except for the one verb. However a closer inspection shows that the Oaxaca Mixean reflexes for the adjective and nouns are unexpected. The normal Mixean reflex of Proto-Mixe-Zoquean CVC words is CVxCC (Oluta CVCi), as the cognate sets in (27) attest.

\textsuperscript{10} Wichmann (1995:514) lists jikik for Rayon ‘black’ next to jikpi, apparently in support of an optional proto-Zoquean reconstruction as a VC reduplicant. However, the fact is that jikkiʔk and jikpi are both adjectival derivations, jik-ihk and jik-pi. -pi is widespread in Zoque, for ihk cf. in ʔuʔ-ang ‘little’, ʔuʔ-tiʔtiny’, ʔuʔ-ihk ‘little, a little’. 
Richard A. Rhodes

The fact that the Oaxaca Mixean reflexes of the nominal monosyllables in (26) contain no \( h \), shows that the history must be different. Consider the reflexes of proto-Mixean bisyllabic verb root inflections, exemplified in (28).

(28)  

\[
\begin{array}{llll}
\text{Proto-Mixean} & \text{Oaxaca Mixean} & \text{Totontepec Mixe} & \text{Coatlán Mixe} & \text{Veracruz Mixean} & \text{Oluta} & \text{Popoluca} & \text{Sayula} & \text{Popoluca} \\
\text{'he leaves'} & \text{\textipa{*pitsim-pa}} & \text{pitsim-p} & \text{pitsim-b} & \text{pitsim-pa} & \text{pitsim-pa} & \text{pitfim-p} & \text{?i-pitfihm} & \text{--} \\

\text{'that he took a walk'} & \text{\textipa{?i-wittit-hi}} & \text{vjidit-j} & \text{j-widiht-j} & \text{?i-vitit-i} & \text{?i-vitit-i} & \text{?i-vitit-i} & \text{?i-vitit-i} & \text{--} \\
\end{array}
\]

The inflection of bisyllabic VC reduplicants shows that when the final two consonants are identical, the vowel deletes in at least some varieties of Oaxaca Mixe.\(^{11}\) This is general in Totontepec, as exemplified in (29).\(^{12}\)

(29)  

\[
\begin{array}{llll}
\text{(a) 'change'} & \text{'he ...s'} & \text{\textipa{tiksp}} & \text{\textipa{tjkits}} \\
\text{'be happy'} & \text{\textipa{saoondkp}} & \text{\textipa{sgoondik}} \\
\text{(b) 'drag'} & \text{\textipa{hoosp}} & \text{\textipa{hjoosis}} & \text{vitp} & \text{\textipa{vjidit}} \\
\text{'take a walk'} & \text{\textipa{vittit}} & \text{\textipa{vjtith}} & \text{\textipa{vjdit}} & \text{\textipa{vjdjt}} & \text{\textipa{vjdjt}} & \text{\textipa{vjdjt}} & \text{\textipa{vjdjt}} & \text{\textipa{vjdjt}} \\
\end{array}
\]

The Oaxaca Mixe forms in (26) are actually reflexes of earlier VC reduplicants with this vowel deletion. Thus the data in (26) constitutes evidence that VC reduplication spread in proto-Mixe.

5.1.3.

There are three forms reconstructible to proto-Oaxaca Mixe with VC reduplication. Only one, *\textipa{tunun} 'pile; hill' has a known cognate outside of Oaxaca Mixean. (See [22(c)] above.) The forms are given in (30).

\(^{11}\) As mentioned above all the Mixe languages except Oluta show the loss of final unstressed vowels. (I will not argue here that I believe Oluta did, too, but then resupplied them by analogy.) The Oaxacan varieties extend this reduction to post-tonic vowels. In slightly different environments in each, the different languages suffer the loss of post-tonic reduced vowels in syllables where coda \( h \)'s are expected. (Cf. Tot. \textipa{vitp} 'he walks' [UL \textipa{vitit}] with Coat \textipa{widiht} cited in (30). Wichmann (1995:128) discusses this general deletion pattern.)

\(^{12}\) However, some lexemes in Totontepec have restored the lost vowel analogically.
VC Reduplication in Sayula Popoluca

\[(30)\] Proto-

- Oaxaca Mixe
  *\text{*mopop} \quad - \quad \text{miböhp} \quad \text{mobo} \quad \text{moböhp} \quad 'that it flaps'
  *\text{sukuk} \quad \text{sigik} \quad \text{sigühk} \quad - \quad \text{sigühk} \quad 'that she makes tortillas'
  *\text{tunun} \quad \text{tinin} \quad \text{tun} \quad \text{tun} \quad \text{tun} \quad 'hill'

*\text{tunun} is inherited from proto-Mixe-Zoquean, but *\text{mopop} and *\text{sukuk} are Oaxaca Mixe innovations.

5.1.4.

There are more VC reduplicant cognates between Oluta and Sayula than between any other two languages, suggesting that there was further spread of VC reduplication in proto-Veracruz Mixe. The forms are given in (31).

\[(31)\] Proto-Veracruz Sayula Oluta Mixe
  *\text{kapap} \quad \text{kâbap} \quad \text{kapa?p} \quad 'side'
  *\text{ma\-kak} \quad \text{ma\-gak} \quad \text{ma\-ka\-k} \quad 'sterile'
  *\text{tatsats-} \quad \text{tâdatsp} \quad \text{tatsats-\text{pa}} \quad 'it drips'
  *\text{tsëkek} \quad \text{tsëgëk} \quad \text{tsëkek-\text{pa}} \quad 'sound of strangling' (Say).
  *\text{jimim-} \quad \text{jimimip} \quad \text{jimim-\text{pa}} \quad 'it is drizzling'

It is this spread which continued into Sayula Popoluca and accounts for the much higher occurrence of VC reduplicants there.

5.1.5

Finally, as pointed out above, Sayula has many more VC reduplicants than any other Mixe-Zoquean language. Most of these must be innovations, but only a few have likely cognates with Sayula’s closest relative, Oluta Popoluca. Part of the difficulty of identifying cognates is that the semantics of VC reduplications are often quite specialized, and therefore often a step or two away from the original meaning of the root. The five most likely cognates are listed in (32).

\[(32)\] Proto-Veracruz Sayula Oluta Mixe
  *\text{hi\-ts-} 'loosen' \quad ʔ\text{i hi\-dits-\text{p}} \quad 'he massages it'
  *\text{hi\-n-} 'scrub' \quad ʔ\text{i hi\-n-\text{p}} \quad 'it falls apart'
  *\text{tsa\-i\-m-} 'swell up' \quad ʔ\text{i tsamam-\text{p}} \quad '[water] oozes up'
  *\text{hi\-ts-\text{pe}} \quad 'he loosens/unties it'
  *\text{hi\-n-\text{pe}} \quad 'he scrubs it'
  *\text{tsam-\text{pa}} \quad 'it swells up/ripen'
  *\text{tsa\-i\-m-\text{am}} \quad 'it will well up/ripen'
5.2.

We have shown in this section that VC reduplication is more prominent in the history of Mixe-Zoquean that it at first appears. Although there are good cognates showing that VC reduplication was present in proto-Mixe-Zoquean, they are few, in part because of its rarity in the Gulf Zoque. The history of the family is that VC reduplication spread in the various branches of the family, but particularly from Proto-Mixe-Zoquean into Proto-Mixe and continued to spread in both branches of Mixe, and it continued to spread in Sayula Popoluca, so that Sayula now has, by far the most instances.

6.

The question then arises: since VC reduplication is never productive in any reasonable sense of the term, how is it that it spreads to apply to new roots?

First, let us observe that the kinds of meanings associated with VC reduplicants reappear across the family even where the reduplicants themselves are not cognate, as exemplified in (33).

(33)

</tbody>
</table>

14 The basis of the semantic shift for this pair comes from the sound of sawing and the sound of dragging something across gravel. Meso-American languages often label sound images rather than visual images. (David Tuggy, p.c.)

13 It is very difficult to work out the history of this word. The first guess would be to say that the Oluta form is old, and that Zoque restructured it as if it were a VC reduplication, but that leaves a problem with the medial consonant in both Oluta pagik- ‘be cold’ and Sayula pájik. In any case the Zoque cognates show VC reduplication.
This means that the process connecting VC reduplicates to these kinds of meanings is natural in the Mixe-Zoquean context. (See Mayerthaler 1987 for a discussion of universal vs. language specific naturalness.) This encompasses meanings that are consistent with reduplications, intensive, pluractional (in the loose sense), and names of flora and fauna. Also included are positionals, a highly marked class of words that specify bodily positions or the orientation or objects in space. Roots having these meanings are available for the extension of the applicability of VC reduplication to them. I propose that the mechanism is Trubetzkoyan analogy, by a logic like that in (34).

\[(34) \quad \text{'sp. plant (guáximo)'} : ? < *\text{'tehk} \ (\text{pre-Sayula})

\quad \text{'sp. plant (bottle gourd)'} : \text{pójok}\]

Once created the forms can be in free variation like ne?tf- and nérêtj- in (15) above. Then one of two things happens, either the simple form is lost or one of the forms, simple or reduplicated, takes on extended meanings. An example of the development of extended meanings is given in (35).

\[(35) \quad CV_iC_1

\quad \text{hot} \quad \text{‘hole’} \quad > \quad CV_iC_1VC_i

\quad \text{horot} \quad \text{‘wide hole’}

\quad \text{horot-na(j)}- \quad \text{‘have a wide hole’}

\quad \text{horot-} \quad \text{‘drink noisily’}\]

Most of the Sayula tokens are of the first kind, which have no available unre duplicated version.

7.

We have seen in Sayula Popoluca a type of thoroughly opaque reduplication which, in spite of being non-productive, has through at least a millenium of sound change retained sufficient vitality to serve as the model for extension of the lexical resources of the language. We have proposed to account for this array of facts by applying the established theory of analogical change.

9. Appendix

Below are given Wichmann’s thirteen reconstructions of proto-Mixe-Zoquean forms with VC reduplication. They are presented in alphabetical order, “nakak ‘frog’ has inconsistent consonantism between proto-Mixe, where it has VC reduplication, and proto-Zoque. “pakVk ‘cold’ has inconsistent vocalism in the second syllable between proto-Mixe and proto-Zoque. Only the latter has VC reduplication. “pos - posos - pohos ‘guava sp.’ has a different medial consonant in proto-Zoque. “pokok ‘cotton tree’ is not warranted in proto-Zoque, and the vowel length in Sayula Popoluca shows that it is not a VC reduplication. “wonon ‘partridge’ is simply not warranted as a reconstruction. The rest of the reconstructions have VC reduplication in proto-Mixe but not in proto-Zoque.
