March 2004
EXECUTIVE SUMMARY *

Smoking among American adults fell by half between 1950 and 2002, yet smoking on U.S. movie screens reached historic heights in 2002, topping levels observed a half century earlier.1 Tobacco's comeback in movies has serious public health implications, because smoking on screen stimulates adolescents to start smoking,2,3 accounting for an estimated 52% of adolescent smoking initiation.

Equally important, researchers have observed a dose-response relationship between teens' exposure to on-screen smoking and smoking initiation: the greater teens' exposure to smoking in movies, the more likely they are to start smoking. Conversely, if their exposure to smoking in movies were reduced, proportionately fewer teens would likely start smoking.

To track smoking trends at the movies, previous analyses have studied the U.S. motion picture industry's top-grossing films with the heaviest advertising support, deepest audience penetration, and highest box office earnings.4,5 This report is the first to examine the U.S. movie industry's total output. It is also the first to identify smoking movies, tobacco incidents and tobacco impressions with the companies that produced and/or distributed the films — and with their parent corporations, which claim responsibility for tobacco content choices.1 Examining Hollywood's product line-up, before and after the public voted at the box office, sheds light on individual studios' content decisions and industry-wide production patterns amenable to policy reform.

We surveyed all U.S.-produced live action films released to theaters in the five years between December 25, 1998, and December 24, 2003, and offer three different measures of smoking in movies:

1. INTENTION: Number of films that include smoking (and those smokefree) by year, Motion Picture Association of America (MPAA) age-classification, and corporation responsible;

2. PERFORMANCE: Number of smoking incidents in these films (an index of smoking intensity) by year, MPAA age-classification, and corporation responsible;

3. IMPACT: Number of smoking impressions (each film's smoking incidents x tickets sold) delivered to theatrical audiences overall, to children aged 6-11 and to teens aged 12-17, by year, MPAA age-classification, and corporation responsible.

* Supported in part by grants from the Richard and Rhoda Goldman Foundation and National Cancer Institute (CA-61021). † “The determinations of the content of those products [original movies and television programming], including whether and how tobacco products are used in the Company's film or television catalogue, represent just a part of the many decisions made on a daily basis by the persons charged with managing those divisions.” — Susan A. Waxenberg, Asst. General Counsel, Time Warner, to the S.E.C., Washington, D.C., Dec. 26, 2003.
Because exposure to smoking in movies accounts for more than half of smoking initiation by U.S. adolescents, we pay particular attention to smoking in movies rated G/PG and PG-13 and to the effect of the proposed R-rating for tobacco use on screen.

**KEY FINDINGS**

Analysis of 776 U.S. movies released in the five years 1999-2003 established that:

- 80% of all films across the board included smoking — almost 90% of R-rated films, 80% of PG-13 movies and 50% of G/PG movies.

- Three media conglomerates — Time Warner, Disney and Sony — accounted for more than half of all movies with smoking and 55% of all tobacco impressions delivered to children and teens.

- The number of a studio’s releases ultimately determined its ranking in most tobacco dimensions. Companies with fewer releases tended to concentrate more of their tobacco incidents in films rated PG-13 but tobacco content patterns were otherwise remarkably uniform across major motion picture companies.

- Confirming past analyses, individual R-rated movies with smoking averaged twice as many tobacco incidents as youth-rated movies with smoking.

- The number of PG-13 releases with smoking has remained stable over five years. A five-year decline in R-rated releases and sharply lower ticket sales in 2003 has shifted the majority of tobacco incidents and impressions into movies rated G, PG and PG-13.

- The U.S. movie industry delivered an estimated 32.6 billion first-run theatrical tobacco impressions to audiences of all ages over the past five years. A quarter of these impressions — 8.3 billion evenly divided between youth-rated and R-rated movies — were delivered to children and teens. Time Warner alone delivered a quarter of child and teen tobacco impressions.

- More first-run tobacco impressions are delivered to teen moviegoers 12-17 than to children 6-11 or young adults 18-34 — 1,350 larger-than-life impressions per capita between 1999 and 2003. This estimate does not include the tobacco impressions delivered by a movie with smoking’s theatrical and on-air advertising trailers or from multiple viewings of the movie on pre-recorded video media and on cable, on-demand and broadcast television.

- By all measures, over the past five years rating on-screen smoking “R” would reduce children’s and teens’ first-run theatrical exposure to tobacco impressions, strongly associated with teens’ smoking initiation, by at least 50%.
**M E T H O D S**

HOW THE SAMPLE WAS ASSEMBLED: U.S. produced, English language, live action (or live-with-animation) theatrical feature films released between December 25, 1998, and December 24, 2003, and grossing at least $500,000 at the box office, were identified using the Internet Movie Database (www.imdbPro.com accessed October 1, 2003, to January 20, 2004). This subscription site’s “advanced search” features enabled screening by release date, box office minimum, and production and/or distribution company. MPAA ratings, corporate participation and box office details for individual titles were researched in the same database.

In all, 810 films were identified. The smoking status of 34 films could not be confirmed and they were dropped from the analysis; 70% (24/34) of these films are smaller “indie” productions, the others niche films from larger studios. Almost half were youth-rated (see list in APPENDIX 3). Their $62.5 million in box office receipts amount to less than 0.2% of the $34.3 billion reported box office gross for the five year sample.

Of the 776 motion pictures retained, 40 films are co-credited because more than one major studio participated in production or U.S. distribution. (For example, 2002’s Mr. Deeds was a co-production of Time Warner’s New Line division and Sony’s Columbia Pictures.) Each corporate parent is given full credit for the film in its individual track record, but totals and summaries by year, by rating, and by smoking status are adjusted to prevent double counting of films. Half the credit for a film is allocated to each studio when calculating each studio’s share of total tobacco incidents and impressions.

TOBACCO INCIDENTS: The smoking content of each film in the five-year sample had been evaluated by the parental review and screening service at ScreenIt.com (accessed October 1, 2003, to January 20, 2004). ScreenIt rates smoking and other film content in these terms:

- **NONE [0]:** No content at all in this category.
- **MINOR [1]:** Just a few incidents, or ones with little or no impact.
- **MILD [2]:** Many incidents such as 3 “s” words or students smoking several times during the movie.
- **MODERATE [3]:** More than just occasional scenes in the category. This rating may raise a warning flag for you.
- **HEAVY [4]:** Many scenes in the category. Steady drinking and frequent drunken behavior throughout a movie would be rated this way.
- **EXTREME [5]:** The movie is full of such scenes in the category. The “Die Hard” type action films (with lots of shooting and deaths) are usually extreme in the violence category.6

To convert these qualitative descriptions to quantitative estimates, we cross tabulated the number of smoking incidents in 601 high-grossing films released 1988-1999, as measured by the Department of Pediatrics at Dartmouth Medical School,7 with
ScreenIt’s ratings. ScreenIt’s database included 389 of the 601 films Dartmouth analyzed. A two-way analysis of variance revealed statistically significant differences in the number of tobacco incidents, as measured by Dartmouth, among ScreenIt’s categories (P<.001) and between MPAA youth-rated (G/P/G/P-13) vs. R-rated films (P<.001), with a significant interaction between ScreenIt’s rating and the MPAA rating (P<.001). We used the average number of incidents observed by Dartmouth investigators as a function of ScreenIt and MPAA rating, and applied these counts to each film (TABLE 1).

TOBACCO IMPRESSIONS: To ascertain how many times each movie was viewed in its domestic theatrical run, domestic box office gross amounts reported on imdbPro.com were divided by the average price of a U.S. movie ticket in 1999, 2000, 2001 and 2002 given by the National Association of Theatre Owners. The ticket price for 2002 was carried over into 2003. The number of in-theater viewings for each film was then multiplied by the film’s assigned tobacco incidents to yield counts of tobacco impressions reliable when aggregated by year, rating or studio.

Statistics for movie attendance, by rating and by age, assembled by Nielsen Media Research, were employed to estimate tobacco impressions delivered to children 6-11, teens 12-17, and young adults 18-34. Total tobacco impressions by rating were multiplied by the fraction of the audience made up of each age group (TABLE 2) to find the number of impressions delivered to children, teens and young adults by G/P/G, PG-13 and R-rated movies with smoking. Results were summed for each studio, by year, and reported as aggregate results.

We also estimated per capita tobacco impressions delivered to children 6-11, teens 12-17, and young adults 18-34. To compare these age groups, we divided total tobacco impressions for each group by the age group’s population in 2001, midway through the 1999-2003 time period, to produce comparable per capita estimates of tobacco impressions.

LIMITATIONS: There are several limitations associated with the tobacco incident procedure which should be kept in mind when interpreting this report’s tables and graphs. First, the Dartmouth investigators evaluated a sample of top-grossing films released between 1988 and 1999, whereas we applied the average number of tobacco incidents that they observed to all films released between 1999 and 2003. This procedure assumes that the application of ScreenIt’s qualitative descriptors remained consistent throughout this entire period. Second, there will be a random element in applying these averages to particular movies, so we do not report quantitative estimates of the number of tobacco incidents for individual movies. Using this procedure in the aggregate over all films produced by a given studio in a given year, however, should give reasonable estimates of the total number of smoking incidents.

1. SMOKING AND SMOKEFREE MOVIES RELEASED 1999-2003

OBSERVATIONS: Tobacco permeated youth-rated (G/P/G-PG-13) and R-rated movies. Over the five years 1999-2003, nearly 90% (324/371) of R-rated movies included smoking. Just under 80% (260/330) of PG-13 movies included smoking and close to half (35/75) of movies rated G or PG included smoking (TABLE 3). In all, 80% (619/776) of U.S. movies presented tobacco use.

The absolute number of youth-rated releases with smoking remained stable at around 60 films per year. Due to a 38% drop in annual R-rated releases (from 91 in 1999 to 56 in 2003) and a proportionate drop in R-rated movies with smoking, the majority of U.S. movies with smoking were youth-rated by 2002 (FIGURE 1A). PG-13 films with smoking grew from 34% (47/138) of 1999 smoking releases to 49% (52/106) in 2003 (FIGURE 1B). G/PG movies, less than 10% of major studio output in any given year, contributed 6% (6/106) of movies with smoking in 2003 and R-rated movies comprised 45% (48/106).

RATING REMEDIES: Assuming that producers would remove smoking and other tobacco promotions from an otherwise youth-rated film to avoid an R-rating, over the five years 1999-2003 an R-rating for tobacco use would have had the practical effect of clearing the smoke from 48% (295/619) of all releases with smoking.

STUDIO COMPARISON: Time Warner, Disney and Sony — the three most prolific movie makers in the U.S. — together released 54% (333/619) of all movies with smoking and

The number of G/P/G-PG-13 movies with smoking held steady while the number of R-rated releases with smoking dropped 38%.

The majority of movies with smoking were youth-rated by 2002.
54% (158/295) of youth-rated movies with smoking (Figure 2). Time Warner and Disney between them released more than half (18/35) of all movies with smoking rated G /PG.

Disney topped all other studios in both the number of PG-13 releases with smoking (52) and, at 88% (52/58), the proportion of its PG-13 films that included smoking. While the industry as a whole included smoking in 79% (260/330) of PG-13 movies, more than 80% of PG-13 movies from News Corp. (36/43), Viacom (28/33) and DreamWorks (14/17) included smoking. At 95% (10/11), DreamWorks ranked first in the share of its R-rated releases to include smoking, closely rivaled by News Corp. (31/34) and Disney (56/61) at 91% each.

By 2003, every major studio’s movies with smoking youth-rated G, PG and PG-13 outnumbered its R-rated movies with smoking, except for Time Warner; its production of R-rated movies with smoking (74) outstripped all other studios over the five years. Time Warner is also unusual in that 60% (3/5) of its 2003 movies rated PG included smoking; only 23% (3/13) of other studios’ PG releases showed smoking in 2003.

2. SMOKING INCIDENTS IN U.S. MOVIES 1999-2003

Observations: In all, the U.S. film industry produced some 5,500 tobacco incidents in movies of all ratings between 1999 and 2003 (Table 4).

70% of tobacco incidents (3848/5488) were in R-rated movies; 27% (1486/5488) in PG-13 movies; and 3% (153/5488) in movies rated G/PG (Figure 3). Mainly because of a drop in the number of releases rated “R,” share of tobacco incidents found in youth-rated movies has grown (Figure 4).

As other analysts have noted, the number of tobacco incidents (tobacco use, brand displays and signage) consistently differs by MPAA rating. In this analysis, individual PG-13 movies with

smoking showed 5 to 6 incidents, on average, while those rated “R” included 11 to 12 (FIGURE 5). Multiple regression analysis of the number of incidents per film revealed that there was no significant change in the levels of tobacco incidents over five years (P=.194) and that there were significantly fewer incidents in youth-rated films (6.1 incidents lower; P<.001).

**RATING REMEDIES:** An R-rating five years ago would have incentivized omission of 30% of all tobacco incidents in U.S. films.

**STUDIO COMPARISON:** Time Warner, Disney and Sony, which produced or distributed 54% of movies with smoking, account for 53% (2927/5488) of all tobacco incidents.

Their share of studios’ tobacco incidents in youth-rated films was higher: 57% (942/1639).

While the industry-wide figure for the number of tobacco incidents found in youth-rated vs. R-rated movies was 30%, many studios exceeded the mean. DreamWorks led all other studios with 44% (71/162). From 34% to 41% of tobacco incidents from Universal (60/389), News Corp. (87/471), Sony (305/779), MGM (12/295), and Viacom (135/399) were also youth-rated.
3. TOBACCO IMPRESSIONS AND YOUNG MOVIEGOERS 1999-2003

Observations: With 100 million movie tickets sold every month, half of them to movies rated PG-13 and a third to movies rated G/PG, thousands of tobacco incidents in hundreds of movies quickly add up to hundreds of millions — and billions — of audience tobacco impressions. A larger proportion of R-rated movies than youth-rated movies include smoking and they carry double the tobacco incidence of youth-rated films, but R-rated movies reach many fewer people than movies rated G, PG and PG-13; they garner only one-fifth of ticket sales.

Overall, the U.S. movie industry delivered 32.6 billion tobacco impressions to audiences of all ages from 1999 through 2003 (TABLE 5). 51.5% of tobacco impressions were delivered by R-rated movies (16.8 billion) and 48.5% by youth-rated films (15.8 billion). Tobacco’s shift from R-rated to youth-rated movies noted in other measures also appears here (FIGURES 6A, 6B): for 2002 and 2003 combined, 56% (6.8 billion/12.2 billion) of all tobacco impressions were delivered by films rated G, PG or PG-13.

Audience Composition: Based on audience composition data, we can estimate the number of tobacco impressions delivered to children 6-11 and teens 12-17.

As might be expected, children form almost a quarter of the audience for G/PG movies and teens about 16% (TABLE 2). Together they fill 40% of the seats for those...
films. Children are a much smaller part of the audience for PG-13 movies and R-rated films. Teens form as big a part of the first-run audience for PG-13 movies (19%) as for R-rated films (21%). But total attendance at R-rated films is 40% of PG-13 films, so fewer than half as many teens 12-17 see R-rated movies in theaters as see movies rated PG-13.

Assigning tobacco impressions, by rating, to child and teen audience components, we calculate that the U.S. movie industry delivered 5% of its tobacco impressions (1.7 billion) to children 6-11 and 20% of its tobacco impressions (6.5 billion) to teens 12-17, for a total of 8.2 billion tobacco impressions in the last five years (TABLE 6). A quarter of all tobacco impressions delivered to theatrical audiences between 1999 and 2003 were delivered to moviegoers younger than eighteen.

Youth-rated movies with smoking and R-rated movies with smoking each delivered half (4.1 billion/8.2 billion) of first-run theatrical tobacco impressions to children and teens 6-17. Movies rated G/PG delivered one-tenth as many tobacco impressions to young people as movies rated PG-13. While teens see about half as many R-rated movies as PG-13 films, the more frequent incidence of tobacco in R-rated movies made them an equal source of tobacco impressions. The magnitude and mix of sources for tobacco impressions is distinctive for children 6-11 and teens 12-17 (FIGURES 7A, 7B).

Nielsen’s audience composition data suggests that adolescents not only receive more tobacco impressions than children, but they are also more exposed than adults. Since teens go to the movies in greater numbers than young adults 18-34, yet attend a similar rating-mix of movies, per
capita annual tobacco impressions delivered to teenage audiences are 20% greater than for young adults 18-34 and 75% greater than for children 6-11 (TABLE 7). The 12-17 age range is when virtually all Americans who become smokers begin experimenting with cigarettes. Adolescents, the age group most heavily exposed to tobacco impressions from first-run Hollywood movies, are also the age group most susceptible to begin smoking.

Note that the figures in this comparison are lower than the exposures to tobacco incidents in 601 top-grossing films estimated by Dalton at al. for teens 10-14.² Our age-group comparative index is made up solely of tobacco impressions delivered by first-run theatrical movies in a single average year, per capita, whereas Dalton et al. were counting all sources of exposure (in theaters and on video) over 2-3 years.

RATING REMEDIES: An R-rating for smoking would have averted 50.4% (4.16 billion/8.2 billion) of the tobacco impressions delivered to children and teens.

STUDIO COMPARISON: Four companies accounted for over 70% (11 billion/15.8 billion) of tobacco impressions delivered by youth-rated movies (FIGURE 8).

Time Warner, Disney, Sony and Viacom accounted for almost two-thirds of all R-rated tobacco impressions (11 billion/16.8 billion). Together, Time Warner, Disney and Sony delivered 57% of impressions to children (1 billion) and 55% of impressions to teens (3.6 billion).
5. CONCLUSIONS

Because smoking in the movies is the most powerful recruiter of teen smokers, public health professionals, including the U.S. Centers for Disease Control and Prevention, California Department of Health Services, New York State Department of Health, Florida Department of Health and Rehabilitative Services, Minnesota Department of Health, Los Angeles County Department of Health Services, the American Lung Association and American Legacy Foundation have invested millions of dollars since 1990 in educational programs intended to sensitize individuals filmmakers about the problem of smoking in the movies and encourage Hollywood to deal with the problem.

Reflecting strong public concern over the effects of smoking in the movies, several public officials, including Vice President Albert Gore, California State Sen. John Burton, and, beginning in 2003, a majority of state attorneys general have also tried to engage Hollywood in a dialog about reducing youth exposure to smoking in movies. The data presented in this report indicates that these efforts directed at individual filmmakers have failed to have any meaningful effect. After falling from 1950 to 1988, the level of smoking in movies has rebounded. As of 2002, tobacco use in movies had returned to levels last seen in 1950.

Recognizing that the educational approach had failed, in 2000 the authors of this report developed a policy-oriented strategy, which includes urging the MPAA to apply an R-rating to movies with smoking or other tobacco promotion as a way to help parents significantly reduce their children’s exposure to smoking in movies.

The dose-response relationship, observed by researchers, between the amount of smoking that youth see on screen and the likelihood that they will begin to smoke means that, just as doubling exposure doubles the likelihood of teen smoking, halving exposure would have the opposite effect. Indeed, it has been shown after controlling for other factors that predict smoking that children of parents who restricted their access to R-rated movies (which cuts their exposure to on-screen smoking) were less likely to start smoking.

In acknowledgement of the need for a policy-based solution, a wide range of health authorities, including the World Health Organization, the American Medical Association, the American Academy of Pediatrics, the Society for Adolescent Medicine, American Legacy Foundation, the American Heart Association, the Campaign for Tobacco Free Kids and others have endorsed an adult content R-rating for films with smoking or other tobacco use.

In response to the proposal to R-rate smoking, some have suggested the “compromise” of a PG-13 rating instead. The data in this report show that a PG-13 rating for smoking would have little practical effect. First, unlike the R-rating, which effectively reduces adolescent access to films by about half, the PG-13 rating does not prevent any child from purchasing a ticket to a film. Second, and most important, there is very little smoking in G and PG films and few of these films are released to begin with.
If studios had eliminated smoking from all G and PG films made during the five years we studied, it would have cleared tobacco imagery from 5.6% (35/619) of all movies with smoking and reduced the five-year total of tobacco incidents on film by just 3%. Children 6-11 would have avoided 13% of their tobacco impressions at the movie theater while teens would have avoided just 2%. Altogether, such a measure might have averted less than 5% (372 million/8.2 billion) of all the tobacco impressions delivered to children and teens over the five years. By any estimate, the R-rating remedy is at least ten times more effective than a PG-13 warning at reducing in-theater tobacco exposure.

We also found that on-screen tobacco impressions delivered to children and teens peak precisely during the years when young non-smokers are most prone to experimentation and smoking initiation.

Tobacco incidents in both youth-rated and R-rated movies have been stable over five years, and the percentage of releases with smoking is basically consistent across the U.S. motion picture industry. While there has been a shift away from tobacco-intensive R-rated releases toward high-grossing PG-13 projects, and a recent slide in first-run ticket sales, no industry commitment to reducing adolescents’ exposure to on-screen smoking is visible in this data. Single-year results and transient market phenomena should not be mistaken for intent: whether theater ticket sales rebound or Hollywood’s corporate owners move to co-opt new distribution channels (or both), ultimately the problem is the product. If the majority of Hollywood’s movies continue to include smoking, the motion picture industry will continue to deliver billions of adolescent tobacco impressions — and new smokers to the tobacco industry.

Certainly, there are some discernible differences among studios when it comes to tobacco content and tobacco impact. Because there is so much consistency in practice, size (number of releases, box office gross) determines most studio tobacco rankings. An index that
allows comparison of each studio’s implication in delivering tobacco impressions divides the studio’s total tobacco impressions (by rating) by the number of its releases (by rating), both smoking and smokefree (FIGURES 9A, 9B). Based on the five years 1999-2003, one can expect any new release to theaters from each of these studios to contribute this many new audience tobacco impressions. Higher numbers mean a studio’s releases are more deeply implicated in delivering tobacco impressions through a combination of the following factors: the percentage of its films that include smoking, levels of tobacco incidents in its releases with smoking, and its ability to attract large audiences.

A striking way to appreciate the degree to which productivity and reach are factors in media companies’ tobacco impact is to rank them by their combined G/PG/PG-13 and R-rated tobacco impressions (FIGURE 10). Note that youth-rated films delivered more tobacco impressions than R-rated movies at six out of the eight major Hollywood studios.

Studios’ shares of estimated tobacco impressions delivered to children and teens (TABLE 8) reflects the tobacco content in their movies of different ratings, the ratings mix of their releases, the number of releases, and their box office reach.

Meanwhile, Hollywood’s five-year shift toward PG-13 productions strengthens the prediction that an R-rating for tobacco use would lead producers to treat smoking as they now treat rough language and sexual situations, routinely calibrating content to preserve the wider audience of a PG-13 release.

The strong association among adolescents between exposure to tobacco use on screen and starting to smoke suggests that current Hollywood practices are initiating 390,000 young people every year into tobacco use and, in that group, eventuating 100,000 premature deaths. An R-rating that cuts adolescents’ exposure in half would avert at least 50,000 tobacco-related deaths annually in future years — a compelling reason to bring smoking within the purview of the MPAA’s age-classification system and set a new standard for responsibility in the U.S. motion picture industry.
