Abstract: Bone formation, remodeling, mineralization, resorption, and healing processes involves a coordinated action of different cell types, which are very prevalent in the elderly population. The current study aimed to evaluate the potential of Consciousness Energy Healing based vitamin D$_3$ and DMEM medium on bone health. Vitamin D$_3$ and DMEM medium as test items (TI), were divided into two parts. One part of each sample received the Consciousness Energy Healing Treatment by Vaibhav Rajan Parulkar and those samples were labeled as the Biofield Energy Treated (BT) samples, while the other parts of each sample were denoted as the untreated test items (UT). Bone health biomarkers such as alkaline phosphatase enzyme (ALP) activity, collagen levels and bone mineralization were studied. The cell viability using MTT assay showed that the test items were found to be safe. ALP level was significantly increased by 304.6%, 237.2%, and 110.6% at 1, 10, and 50 µg/mL, respectively in BT-DMEM+UT-TI, while 356.9%, 186.2%, and 87.3% at 1, 10, and 50 µg/mL, respectively in the BT-DMEM+BT-TI group as compared to the untreated group. Collagen content was significantly increased up to 163.7%, 114.4%, and 22.7% at 0.1, 1, and 10 µg/mL, respectively in the UT-DMEM+BT-TI group, while 190.1%, 64.9%, and 50% increased collagen at 0.1, 1, and 10 µg/mL, respectively in the BT-DMEM+BT-TI group as compared with the untreated group. Moreover, the percent of bone mineralization was significantly increased by 330% and 121.5% at 0.1 and 1 µg/mL, respectively in the BT-DMEM+BT-TI group, while 146.7% and 305.9% at 0.1 and 1 µg/mL, respectively in the BT-DMEM+UT-TI group, as compared with the untreated group. In conclusion, the Biofield Energy Treated vitamin D$_3$ could be a powerful alternative dietary sources and supplements to fight against various bone related diseases including low bone density and osteoporosis, Paget’s disease of bone, rickets, deformed bones, osteomalacia, bone and/or joint pain, increased frequency of fractures, osteoma, hormonal imbalance, stress, aging, bone loss and fractures.

Keywords: Biofield Energy Healing, Osteosarcoma Cells (MG-63), Dietary Supplement, ALP, Collagen, Bone Mineralization

1. Introduction

Vitamin D has multiple effects, which regulate the functions in different organs such as brain, lungs, liver, kidneys, and heart, immune, skeletal, and reproductive systems. Moreover, it has significant anti-inflammatory, anti-
arthritic, anti-osteoarthritis, anti-stress, anti-aging, anti-apoptotic, wound healing, anti-cancer, anti-psychotic, and anti-fibrotic roles. Vitamin D receptors (VDRs) are widely present in most of the body organs like brain, heart, lungs, kidney, liver, pancreas, large and small intestines, muscles, reproductive, nervous system, etc. [1]. VDRs influence cell-to-cell communication, normal cell growth, cell differentiation, cell cycling and proliferation, hormonal balance, neurotransmission, skin health, immune and cardiovascular functions. Bone-related health issues become a major problem among the population from village to the cities. Vitamin D plays a vital role in preserving a healthy mineralized skeleton of most of the vertebrates including humans. Cod liver oil, irradiation of other foods including plants, sunlight, etc. are found to be effective against bone related disorders, which lead to discovering the active principle- vitamin D [1]. The role of vitamin D has been well defined not only for improving the bone mineralization but also with increased bone resorption, aging, inflammation and overall quality of life. Vitamin D3 is synthesized in the skin by sunlight and once formed it sequentially metabolized in the liver and kidney to 1,25-dihydroxyvitamin D (calcitriol, the vitamin D hormone) [2]. Calcitriol play an important role in maintaining the normal level of calcium and phosphorus, promotes bone mineralization, induce or repress the genes responsible for conserving the mineral homeostasis and skeletal integrity, and inhibit hypertension, kidney damage, cardiovascular and immune disorders (such as Lupus, Addison Disease, Graves’ Disease, Hashimoto Thyroiditis, Multiple Sclerosis, Myasthenia Gravis, Anemia, Sjogren Syndrome, Systemic Lupus Erythematosus, Diabetes, Alopecia Areata, Fibromyalgia, Vitiligo, Psoriasis, Scleroderma, Chronic Fatigue Syndrome and Vasculitis), and the secondary hyperparathyroidism [3]. Vitamin D insufficiency and deficiency is the major health problem, which causes metabolic bone disease in the young and elderly populations [4]. Fortified foods have a variable amount of vitamin D and most of the foods do not contain vitamin D, which can be fulfilled using some supplements. In order to avoid the bone related disorders such as osteomalacia, exacerbate osteoporosis, hyperparathyroidism, immune disorders, etc. calcium 1000-1500 mg/day along with vitamin D supplement around 400 IU/day is very important for maintaining the good bone health [5].

Various in vitro studies have readily demonstrated the role of bone health using cell lines and its resorbing effects using three important key biomarkers, such as alkaline phosphatase (ALP), collagen and calcium. MG-63 cell line derived from juxtacortical osteosarcoma, which represents an immature osteoblast phenotype and undergoes temporal development in long term culture. The response of MG-63 cells to 1,25-dihydroxyvitamin D3 (1,25(OH)2 D3) administration has been studied to be similar to normal human osteoblast cells [6]. Hence, MG-63 cell line is widely used for studying the potential of any test compounds to improve the bone health [7]. The formation of new bone involves a complex series of events including the proliferation and differentiation of osteoblasts, and eventually the formation of a mineralized extracellular matrix. ALP is a phenotypic marker for the early differentiation and maturation of osteoblasts. ALP increases the local concentration of inorganic phosphate for bone mineralization and hence is an important marker for osteogenic activity [8]. Similarly, active osteoblasts synthesize and extrude collagen, which plays an important role in the formation of bone extracellular matrix by providing strength and flexibility. Collagen fibrils formed an arrays of an organic matrix known as Osteoid [9]. Likewise, calcium phosphate is deposited in the Osteoid and gets mineralized (combination of calcium phosphate and hydroxyapatite) and provides rigidity to the bone [10].

Thus, these parameters are very essential in order to study the bone health in cell lines. Authors evaluated the in vitro effect of the Biofield Energy Treated vitamin D3 as a test item, a Complementary and Alternative Medicine (CAM) on bone health using MG-63 cell line for major biomarkers. Within the burgeoning ground of CAM therapies, Biofield Energy Treatment or energy medicine, is emerging with significant benefits in various scientific fields. The effects of the CAM therapies have great potential, which include external qigong, Johrei, Reiki, therapeutic touch, polarity therapy, pranic healing, deep breathing, yoga, Tai Chi, Qi Gong, chiropractic/osteopathic manipulation, meditation, massage, special diets, homeopathy, progressive relaxation, guided imagery, acupuncture, relaxation techniques, hypnotherapy, healing touch, movement therapy, pilates, Rolffing structural integration, mindfulness, Ayurvedic medicine, traditional Chinese herbs and medicines in biological systems both in vitro and in vivo [11]. Biofield Energy Healing Treatment (The Trivedi Effect®) contain a putative bioenergy, which is channeled by a renowned practitioners from a distance. Biofield Energy Healing as a CAM showed a significant results in biological studies [12]. However, the National Center for Complementary and Alternative Medicine (NCCAM), well-defined Biofield therapies in the subcategory of Energy Therapies [13]. The Trivedi Effect®- Consciousness Energy Healing Treatment has been reported with significant revolution in the physicochemical properties of metals, chemicals, ceramics and polymers [14-17], improved agricultural crop yield, productivity, and quality [18-20], transformed antimicrobial characteristics at genetic level [21-23], biotechnology [24-26], skin health [27, 28], nutraceuticals [29, 30], cancer research [31, 32], and human health and wellness.

Based on the significant outcomes of Biofield Energy Treatment and vital role of vitamin D3 on bone health, authors sought to evaluate the impact of the Biofield Energy Treatment (The Trivedi Effect®) on vitamin D3 as test sample for bone health activity with respect to the assessment of different bone health parameters like ALP, collagen content, and bone mineralization using standard in vitro assays in MG-63 cells.
2. Material and Methods

2.1. Chemicals and Reagents

Rutin hydrate was purchased from TCI, Japan, while vitamin D\textsubscript{3} (denoted as test item) and L-ascorbic acid were obtained from Sigma-Aldrich, USA. Fetal bovine serum (FBS) and Dulbecco’s Modified Eagle’s Medium (DMEM) were purchased from Life Technology, USA. Antibiotics solution (penicillin-streptomycin) was procured from HiMedia, India, while 3-(4, 5-diamethyl-2-thiazolyl)-2, 5-diphenyl-2H-tetrazolium) (MTT), Direct Red 80, and ethylene diamine tetra acetic acid (EDTA) were purchased from Sigma, USA. All the other chemicals used in this experiment were analytical grade procured from India.

2.2. Cell Culture

Human bone osteosarcoma cell line -MG-63 was used as test system in the present study. The MG-63 cell line was maintained in DMEM growth medium for routine culture supplemented with 10% FBS. Growth conditions were maintained as 37°C, 5% CO\textsubscript{2} and 95% humidity and subcultured by trypsinisation after splitting the cell suspension into fresh flasks and supplementing with fresh cell growth medium. Three days before the start of the experiment (i.e., day -3), the growth medium of near-confluent cells was replaced with fresh phenol-free DMEM, supplemented with 10% charcoal dextran stripped FBS (CD-FBS) and 1% penicillin-streptomycin [33].

2.3. Experimental Design

The experimental groups consisted of cells in baseline control, vehicle control groups (0.05% DMSO with Biofield Energy Treated and untreated DMEM), positive control group (rutin hydrate) and experimental test groups. The experimental groups included the combination of the Biofield Energy Treated and untreated vitamin D\textsubscript{3}/DMEM. It consisted of four major treatment groups on specified cells with Untreated-DMEM + Untreated-Test item (UT-TI), UT-DMEM + Biofield Energy Treated test item (BT-TI), BT-DMEM + UT-TI, and BT-DMEM + BT-TI.

2.4. Consciousness Energy Healing Treatment Strategies

The test item and DMEM were divided into two parts. One part each of the test item and DMEM was treated with the Biofield Energy by a renowned Biofield Energy Healer (also known as The Trivedi Effect\textsuperscript{\texttrademark}) and coded as the Biofield Energy Treated item, while the second part did not receive any sort of treatment and was defined as the untreated samples. This Biofield Energy Healing Treatment was provided by Vaibhav Rajan Parulkar remotely for ~5 minutes. Biofield Energy Healer was remotely located in the USA, while the test samples were located in the research laboratory of Dabur Research Foundation, New Delhi, India. This Biofield Energy Treatment was administered for 5 minutes through the Healer’s unique Energy Transmission process remotely to the test samples under laboratory conditions. Vaibhav Rajan Parulkar in this study never visited the laboratory in person, nor had any contact with the test item and medium. Further, the control group was treated with a sham healer for comparative purposes. The sham healer did not have any knowledge about the Biofield Energy Treatment. After that, the Biofield Energy Treated and untreated samples were kept in similar sealed conditions for experimental study.

2.5. Determination of Non-Cytotoxic Concentration

The cell viability was performed by MTT assay in human bone osteosarcoma cell line (MG-63). The cells were counted and plated in 96 well plates at the density corresponding to 5 X 10\textsuperscript{3} to 10 X 10\textsuperscript{3} cells/well/180 µL of cell growth medium. The above cells were incubated overnight under growth conditions and allowed the cell recovery and exponential growth, which were subjected to serum stripping or starvation. The cells were treated with the test item, DMEM, and positive control. The untreated cells were served as baseline control. The cells in the above plate (s) were incubated for a time point ranging from 24 to 72 hours in CO\textsubscript{2} incubator at 37°C, 5% CO\textsubscript{2}, and 95% humidity. Following incubation, the plates were taken out and 20 µL of 5 mg/mL of MTT solution were added to all the wells followed by additional incubation for 3 hours at 37°C. The supernatant was aspirated and 150 µL of DMSO was added to each well to dissolve formazan crystals. The absorbance of each well was read at 540 nm using Synergy HT micro plate reader, BioTek, USA [34]. The percentage cytotoxicity at each tested concentrations of the test substance were calculated using the following equation (1):

\[
\text{% Cytotoxicity} = \frac{1 - \text{R}}{\text{X}} \times 100 \tag{1}
\]

Where, \( \text{X} \) = Absorbance of treated cells; \( \text{R} \) = Absorbance of untreated cells

The percentage cell viability corresponding to each treatment was obtained using the following equation (2):

\[
\text{% Cell Viability} = 100 - \text{% Cytotoxicity} \tag{2}
\]

The concentrations exhibiting ≥70% Cell viability was considered as non-cytotoxic.

2.6. Assessment of Alkaline Phosphatase (ALP) Activity

The cells were counted using an hemocytometer and plated in a 24-well plate at the density corresponding 1 x 10\textsuperscript{4} cells/well in phenol free DMEM supplemented with 10% CD-FBS. Following respective treatments, the cells in the above plate were incubated for 48 hours in CO\textsubscript{2} incubator at 37°C, 5% CO\textsubscript{2}, and 95% humidity. After 48 hours of incubation, the plate was taken out and processed for the measurement of ALP enzyme activity. The cells were washed with 1X PBS and lysed by freeze thaw method i.e., incubation at -80°C for 20 minutes followed by incubation at 37°C for 10 minutes. To the lysed cells, 50 µL of substrate solution i.e., 5 mM of p-nitrophenyl phosphate (pNPP) in 1M diethanolamine and 0.24 mM magnesium chloride (MgCl\textsubscript{2})
solution (pH 10.4) was added to all the wells followed by incubation for 1 hour at 37°C. The absorbance of the above solution was read at 405 nm using Synergy HT micro plate reader (Biotek, USA). The absorbance values obtained were normalized with substrate blank (pNPP solution alone) absorbance values [33]. The percentage increase in ALP enzyme activity with respect to the untreated cells (baseline group) was calculated using equation (3):

\[
\% \text{ Increase} = \left( \frac{X - R}{R} \right) \times 100
\]

Where, \( X = \) Absorbance of cells corresponding to positive control or test groups
\( R = \) Absorbance of cells corresponding to baseline group (untreated cells)

2.7. Assessment of Collagen Synthesis

The MG-63 cells were counted using an hemocytometer and plated in 24-well plate at the density corresponding to 10 x 10^3 cells/well in phenol free DMEM supplemented with 10% CD-FBS. Following respective treatments, the cells in the above plate were incubated for 48 hours in CO2 incubator at 37°C, 5% CO2, and 95% humidity. After 48 hours of incubation, the plate was taken out and the amount of collagen accumulated in MG-63 cells corresponding to each treatment was measured by Direct Sirius red dye binding assay. In brief, the cell layers were washed with PBS and fixed in Bouin’s solution (5% acetic acid, 9% formaldehyde and 0.9% picric acid) for 1 hour at room temperature (RT). After 1 hour of incubation, the above wells were washed with milliQ water and air dried. The cells were then stained with Sirius red dye solution for 1 hour at RT followed by washing in 0.01 N HCl to remove unbound dye. The collagen dye complex obtained in the above step was dissolved in 0.1 N NaOH and absorbance was read at 540 nm using Biotek Synergy HT micro plate reader [33]. The percentage increase in collagen level with respect to the untreated cells (baseline group) was calculated using equation (4):

\[
\% \text{ Increase} = \left( \frac{X - R}{R} \right) \times 100
\]

Where, \( X = \) Collagen levels in cells corresponding to positive control or test groups
\( R = \) Collagen levels in cells corresponding to baseline (untreated) group

2.8. Assessment of Bone Mineralization by Alizarin Red S Staining

The MG-63 cells were counted using an hemocytometer and plated in 24-well plate at the density corresponding to 10 x 10^3 cells/well in phenol free DMEM supplemented with 10% CD-FBS. Following respective treatments, the cells in the above plate were incubated for 48 hours in CO2 incubator at 37°C, 5% CO2, and 95% humidity to allow cell recovery and exponential growth. Following overnight incubation, the above cells will be subjected to serum stripping for 24 hours. The cells will then be treated with non-cytotoxic concentrations of the test samples and positive control. After 3-7 days of incubation with the test samples and positive control, the plates were taken out cell layers and processed further for staining with Alizarin Red S dye. The cells were fixed in 70% ethanol for 1 hour, after which Alizarin Red solution (40 µm; pH 4.2) was added to the samples for 20 minutes with shaking. The cells were washed with distilled water to remove unbound dye. For quantitative analysis by absorbance evaluation, nodules were solubilized with 10% cetylpyridinium chloride for 15 minutes with shaking. Absorbance was measured at 562 nm using Biotek Synergy HT micro plate reader [33]. The percentage increase in bone mineralization with respect to the untreated cells (baseline group) was calculated using the following equation (5):

\[
\% \text{ Increase} = \left( \frac{X - R}{R} \right) \times 100
\]

Where, \( X = \) Absorbance in cells corresponding to positive control or test groups; \( R = \) Absorbance in cells corresponding to baseline (untreated) group.

2.9. Statistical Analysis

All the values were represented as percentage of respective parameters. For multiple group comparison, one-way analysis of variance (ANOVA) was used followed by post-hoc analysis by Dunnett’s test. Statistically significant values were set at the level of \( p \leq 0.05\).

3. Results and Discussion

3.1. MTT Assay- Non-Cytotoxic Effect of the Test Item

All the test samples were screened for cell viability in MG-63 cells at different concentrations. MTT assay is one of the preliminary method of biological evaluation and screening tests of any test sample using cells in vitro in order to study the cell growth, proliferation, its reproduction and morphological effects. The experimental data showed that all the test samples in combination at different concentrations were found to have significant cell viability with more than 70%. The cell viability results are graphically presented in Figure 1. These data suggests that the test item along with DMEM groups were found safe at all the tested concentrations range up to maximum of 100 µg/mL against the tested MG-63 cells.
3.2. Evaluation of Alkaline Phosphatase (ALP) Enzyme Activity

For the estimation of ALP level, effect of all the test samples viz. Biofield Energy Treated test item and DMEM was tested at various experimental test item concentrations on MG-63 cell line (Figure 2). The positive control, rutin showed a significant increased value by 38.8%, 43.6%, and 80.9% at 0.01, 0.1, and 1 µg/mL, respectively with respect to the untreated cells. The experimental test group’s viz. untreated medium and Biofield Treated Test item (UT-DMEM+BT-TI) showed a significant increase in ALP level by 144.6%, 127.7%, and 27.5% at 1, 10, and 50 µg/mL, respectively while Biofield Treated medium and untreated Test item (BT-DMEM+UT-TI) showed a significant increased ALP level by 304.6%, 237.2%, and 110.6% at 1, 10, and 50 µg/mL, respectively as compared with the untreated test item and DMEM group. However, the Biofield Energy Treated medium and Biofield Energy Treated Test item (BT-DMEM+BT-TI) showed a significant increased ALP level by 356.9%, 186.2%, and 87.3% at 1, 10, and 50 µg/mL, respectively as compared with the untreated test item and DMEM group. Overall, all the experimental test groups showed a significant improved level of ALP at all the tested concentrations.

Serum ALP, one of the common biomarker used of bone formation. ALP enzyme present throughout the body and plays an important role in osteoid formation and bone mineralization. In addition, it is present as several dimeric isoforms such as the liver, bone, intestine, spleen, kidney, and placenta. Reduced serum bone ALP level leads to different bone disorders such as osteoporosis, which is the major health problem in middle and old-aged women and in postmenopausal women along with other pathological conditions, such as certain bone cancers, Paget’s disease of bone, osteoporosis, healing fracture, bone growth, acromegaly, myelofibrosis, osteogenic sarcoma, or bone metastases, leukemia, and rarely myeloma [35]. Osteoporosis is an important public health problem in middle-aged and older women [36]. Osteoporosis is more common in postmenopausal women and not only gives rise to morbidity but also markedly diminishes the quality of life in this population. Vitamin D, calcium, and other bone health supplements play a major role to combat the bone related disorders. [37]. Hence, The Trivedi Effect®-Energy of Consciousness Healing based vit D₃ and DMEM can be used to improve the ALP concentration in many bone disorders.
3.3. Effect of Test Items on Collagen Synthesis

For the estimation of collagen, Biofield Energy Treated vit D3 and DMEM were studied at different concentrations and data showed a significant increase in the collagen level. The experimental results in term of % increase in collagen synthesis with respect to untreated cells are presented in Figure 3. The positive control, rutin showed a significant increased value of collagen by 7.1%, 24.0, and 50.3% at 0.001, 0.01, and 0.1 µg/mL, respectively. The experimental test group’s viz. UT-DMEM+BT-TI showed a significant increased collagen level by 163.7%, 114.4%, and 22.7% at 0.1, 1, and 10 µg/mL, respectively while BT-DMEM+UT-TI group showed a significant increased collagen level by 159.3%, 59.5%, and 40.2% at 0.1, 1, and 10 µg/mL, respectively as compared with the untreated test item and DMEM group. However, BT-DMEM+BT-TI group showed a significant increased collagen level by 190.1%, 64.9%, and 50% at 0.1, 1, and 10 µg/mL, respectively as compared with the untreated test item and DMEM group. Overall, all the experimental Biofield Energy Treated test item and DMEM groups showed a significant improved level of collagen at all the tested concentrations compared with the untreated group.

Collagen reduces joint pains and degeneration and dietary hydrolyzed collagen peptides might effectively prevent various age-related bone loss. Collagen improves cartilage growth, comforts and supports weak joints, while it is more effective than other bone macro and micro molecules [38]. Nutraceuticals are required in order to fulfill the requirements of collagen and other minerals required for bone health. Collagen provide elasticity to the connective tissue, such as cartilage, bones, tendons and ligaments. Undenatured type II collagen is very well know provide improved joint comfort, repair of cartilage, elasticity, reduce inflammation, and mobility in patients suffering from joint damage [39]. Besides, age, gender, ethnicity, body size, and family history play major role as risk factors in case of osteoporosis-related fracture in lifetime. Thus, it can be concluded that Biofield Energy (The Trivedi Effect®) Treated vit D3 and DMEM were studied on bone mineralization, which reflects calcium synthesis and data showed a significant increase in the percentage bone mineralization process on MG-63 cell line. The results of bone mineralization among different experimental groups have been presented in Figure 4. The positive control, rutin showed a significant increased value of bone mineralization by 50.5%, 86.2%, and 130.6% at 5, 10, and 25 µg/mL, respectively. The experimental data among test group’s viz. UT-DMEM+BT-TI showed a significant increased bone mineralization by 44.3% at 10 µg/mL, while BT-DMEM+UT-TI group showed a significant increased bone mineralization by 146.7%, 305.9%, and 41.5% at 0.1, 1, and 10 µg/mL, respectively as compared with the untreated test item and DMEM group. However, BT-DMEM+BT-TI group showed a significant increased bone mineralization by 330% and 121.5% at 0.1 and 1 µg/mL, respectively as compared with the untreated test item and DMEM group. Overall, all the experimental Biofield Energy Treated test item and DMEM groups showed a significant improved level of bone mineralization at all the tested concentrations compared with the untreated group.

3.4. Effect of Test Items on Bone Mineralization

The effect of the Biofield Energy Treated vit D3 and DMEM were studied on bone mineralization, which reflects calcium synthesis and data showed a significant increase in the percentage bone mineralization process on MG-63 cell line. The results of bone mineralization among different experimental groups have been presented in Figure 4. The positive control, rutin showed a significant increased value of bone mineralization by 50.5%, 86.2%, and 130.6% at 5, 10, and 25 µg/mL, respectively. The experimental data among test group’s viz. UT-DMEM+BT-TI showed a significant increased bone mineralization by 44.3% at 10 µg/mL, while BT-DMEM+UT-TI group showed a significant increased bone mineralization by 146.7%, 305.9%, and 41.5% at 0.1, 1, and 10 µg/mL, respectively as compared with the untreated test item and DMEM group. However, BT-DMEM+BT-TI group showed a significant increased bone mineralization by 330% and 121.5% at 0.1 and 1 µg/mL, respectively as compared with the untreated test item and DMEM group. Overall, all the experimental Biofield Energy Treated test item and DMEM groups showed a significant improved level of bone mineralization at all the tested concentrations compared with the untreated group.
The role of vitamin D and calcium in bone formation and mineralization has a well-recognized. The deficiency of calcium and vitamin-D plays a major role in bone related disorders such as osteoporosis. Moreover, calcium is very essential for fracture-callus mineralization. Bone mineralization can be improved by vitamin D along with increased bone resorption. Osteoporosis patients, there were a progressive decline in bone health with increased fracture risk. In addition, vitamin and calcium deficiency leads bone mineralization impairment and bone damage that results in bone-softening diseases such as rickets and osteomalacia. Thus, calcium and vitamin supplements improve the bone health [40, 41]. Our experimentation results showed that the Biofield Energy Treated vit D₃ and DMEM would play a major role in various bone related disorders and have distinct roles during the bone recovery process.

4. Conclusions

Biofield Energy Healing based vitamin D₃ and DMEM showed significant effects on bone health parameters in MG-63 cell line. The test samples were first screened for cell viability using MTT assay, which suggest a significant improved cell viability with more than 70% in all the test samples at various concentrations. Further, bone health parameters such as ALP data showed that the Biofield Energy Treated test samples showed a significant improved level of ALP by 144.6% and 127.7% in the UT-DMEM+BT-TI at 1 and 10 µg/mL, respectively, while 304.6%, 237.2%, and 110.6% increased at 1, 10, and 50 µg/mL in the BT-DMEM+UT-TI group. Additionally, the ALP level was increased by 356.9%, 186.2%, and 87.3% at 1, 10, and 50 µg/mL, respectively in the BT-DMEM+BT-TI group as compared with the untreated test item and DMEM group. The level of collagen was significantly increased by 163.7% and 114.4% at 0.1 and 1 µg/mL, respectively in the UT-DMEM+BT-TI group, while 159.3%, 59.5%, and 40.2% increased collagen was reported at 0.1, 1, and 10 µg/mL, respectively in the BT-DMEM+UT-TI group as compared with the untreated test item and DMEM group. In addition, the level of collagen was increased by 190.1%, 64.9%, and 50% at 0.1, 1, and 10 µg/mL, respectively in the BT-DMEM+BT-TI group as compared with the untreated test group. Similarly, the bone mineralization percent was significantly increased by 44.3% at 10 µg/mL in the UT-DMEM+BT-TI group, while 146.7%, 305.9%, and 41.5% at 0.1, 1, and 10 µg/mL, respectively in the BT-DMEM+UT-TI, and 330% and 121.5% at 0.1 and 1 µg/mL, respectively in the BT-DMEM+BT-TI groups, respectively as compared with the untreated test group. Overall, the Biofield Energy Treated (The Trivedi Effect) test samples were found to have significant impact on tested bone health parameters viz. collagen, calcium and ALP, which are very vital to combat the bone disorders. Therefore, the Consciousness Energy Healing based vitamin D₃ might be a suitable alternative nutritional supplement, which could be useful for the management of various bone related disorders viz. osteoma, low bone density and osteoporosis, rickets, osteomalacia, bone and/or joint pain, osteogenesis imperfecta, Paget’s disease of bone, increased frequency of fractures, deformed bones, chondrodystrophia fetalis, and other bone diseases that are caused by poor nutrition, genetics, or problems with the rate of bone growth or rebuilding. Biofield Energy Treated Vitamin D₃ can be useful as anti-inflammatory, anti-arthritis, anti-osteoporosis, anti-stress, anti-aging, anti-apoptotic, wound healing, anti-cancer, anti-psycho and anti-fibrotic roles. It also influence cell-cell communication, normal cell growth, cell differentiation, cell cycling and proliferation, hormonal balance, neurotransmission, skin health, immune and cardiovascular functions.
