**Enhancing Resident Engagement and Knowledge Retention through Curricular Modifications**

**Background:** Emergency medicine is a specialty filled with individuals ill suited to sit in a lecture hall for long periods. Despite this, 5 subsequent hours of 50 minute blocks are commonly used to meet Residency Review Committee conference requirements. These prolonged sessions test the patience of the audience and impact knowledge retention.

**Educational Objectives:** At Washington University School of Medicine, we’ve implemented changes to combat boredom while enhancing retention.

**Curricular Design:** We addressed the issue of fatigue and boredom when sitting through 5 hours of lecture by dividing lectures into 25 minute slots rather than the traditional 50 minutes. This rapid-fire lecture style minimizes lapses in attention, which studies have shown occur roughly every 10-15 minutes. One challenge has been preventing lecturers from delivering 50 minutes of content in only 25. Additionally, the audience must get adequate breaks, as most people cannot maintain continuous attention for more than about 45 minutes. We addressed this obstacle by using a timer that runs continuously during conference, giving the speaker a 5 minute warning followed by an alert that their lecture time is over. This dramatically improves the ease in which a long-winded lecturer can be curtailed. Finally, we implemented spaced-repetition. This is a well-proven method of enhancing knowledge retention. The key points are repeated to the residents 3 times. First during the lecture itself, second as a rapid-fire summary of the entire day of content at the end of conference, and a third time as a faculty run review the following week.

**Impact:** As this is a cutting-edge curricular change, we have little evidence to its effectiveness. While we don’t have internal evidence, there is a large body of educational literature to support these initiatives. Conference feedback and evaluations improved dramatically over the past six months. Our hope is that inservice scores will reflect the benefit of our new curricular design.

**Faculty Prediction of In-training Examination Scores of Emergency Medicine Residents: A Multi-center Study**

**Background:** The Emergency Medicine In-Training Examination (EMITE) is one of the few valid tools for medical knowledge assessment in use by emergency medicine programs. To determine whether patients were able to separate and rank residents on the individual competencies compared for each resident's score for the competency based questions were analyzed in a correlation matrix.

**Results:** During the 2 month period of the study 286 patients evaluated 29 residents yielding an average of 9.8 evaluations per resident. To determine whether patients were able to separate and rank residents on the individual competencies we compared Pearson correlation coefficients across each resident’s score for the competency based questions. The resulting correlation matrix yielded 28 combinations. The patient rankings for all of these scores were highly correlated. The correlations ranged from 0.78 to 0.97 and all were significant at p<0.001.

**Conclusion:** When patients evaluate resident performance using a competency based form, the results obtained across multiple competency based questions are highly correlated. Patients do not discriminate well between individual competency based constructs when performing clinical evaluations of residents.
Feasability of Improving Bedside Teaching through Targeted Simulation-Based Education for Faculty

Elahi N, Aghera A, Marshall J, Gillett B / Maimonides Medical Center, Brooklyn, NY

**Background:** Long lasting learning is maximized when educational activities are paired with matched clinical bedside teaching. Conversely, lack of bedside teaching for a given topic likely impairs any educational initiative to close knowledge gaps. Managing ventilators in the emergency department is an example of a topic with potential asynchrony of formal education and practical bedside teaching.

**Objectives:** To determine if targeted simulation-based faculty education could enhance bedside teaching in the domain of mechanical ventilation.

**Methods:** First, a needs analysis was performed at an urban community academic hospital, asking emergency medicine residents to rate the frequency of bedside teaching when caring for patients who require mechanical ventilation on a rating scale of 1 to 4 (1=never, 4=always). A prospective cohort study was then done on 27 out of 44 faculty members who participated in a one-hour advanced simulation-based mechanical ventilation course. Faculty self-rated their pre- and post-course competency of ventilator management on a novice to expert Dreyfus scale from 1 to 5. They also rated their current frequency of bedside teaching regarding ventilator management and their anticipated frequency of teaching after completing the course on a rating scale from 1 to 4 (1=never, 4=always).

**Results:** 33 of 48 residents responded to the needs analysis survey, with average and median ratings of 1.52 and 1, respectively. Before and after the course, average faculty self-ratings of competency on the Dreyfus Scale improved from 2.7 to 3.6 (p<0.001), with median ratings improving from 3 to 4. Average ratings of current and anticipated frequency of bedside teaching improved from 2.3 to 3.1 (p<0.001), with median ratings improving from 2 to 3.

**Conclusion:** Emergency medicine residents report a low frequency of bedside teaching related to mechanical ventilation. Targeted simulation-based education for faculty has the potential to significantly improve the frequency of bedside teaching of this topic.

Get Feedback Now: How to Best Use Your Residency Management Software to Increase the Response Rate and Quality of Conference Evaluations

Shin N, Simcoe R, Sule H, Massone R, Hall R / Thomas Jefferson University, Philadelphia, PA; Rutgers, University of Medicine and Dentistry (UMDNJ)-New Jersey Medical School, Newark, NJ

**Introduction:** Feedback is a vital ingredient for successful post-graduate medical education. It is required by the Accreditation Council for Graduate Medical Education for assessment and improvement of key aspects of the residency program, one of which is the mandatory weekly conferences. Audience feedback allows for presenters and residency leadership to make adjustments to future content to better meet the needs of the residents. It is most useful when the collective feedback is numerous, timely, and organized.

**Educational Objectives:** Optimize collection of feedback survey forms using a residency management software, handheld technology (tablet/smartphone), internet access, and protected time following presentations.

**Curricular Design:** A prospective cohort study of emergency medicine residents and teaching faculty at an academic hospital was conducted. Evaluations of weekly residency conferences were collected from 8/7/14-11/20/14 using the “Conference Survey” function within the New Innovations...
